

CRISP-DM

Overview

- **Introduction to CRISP-DM**
- **Phases and Tasks**
- **Summary**

CRISP-DM

CRoss-**I**ndustry **S**tandard **P**rocess
for **D**ata **M**ining

Why Should There be a Standard Process?

The data mining process must be **reliable and repeatable by people with little data mining background.**

Why Should There be a Standard Process?

- **Framework for recording experience**
 - Allows projects to be replicated
- **Aid to project planning and management**
- **“Comfort factor” for new adopters**
 - Demonstrates maturity of Data Mining
 - Reduces dependency on “stars”

Process Standardization

- **Initiative launched in late 1996 by three “veterans” of data mining market.**
Daimler Chrysler (then Daimler-Benz), SPSS (then ISL) , NCR
- **Developed and refined through series of workshops** (from 1997-1999)
- **Over 300 organization contributed to the process model**
- **Published CRISP-DM 1.0** (1999)
- **Over 200 members of the CRISP-DM SIG worldwide**
 - **DM Vendors** - SPSS, NCR, IBM, SAS, SGI, Data Distilleries, Syllogic, etc.
 - **System Suppliers / consultants** - Cap Gemini, ICL Retail, Deloitte & Touche, etc.
 - **End Users** - BT, ABB, Lloyds Bank, AirTouch, Experian, etc.

CRISP-DM

- **Non-proprietary**
- **Application/Industry neutral**
- **Tool neutral**
- **Focus on business issues**
 - As well as technical analysis
- **Framework for guidance**
- **Experience base**
 - Templates for Analysis

CRISP-DM: Overview

CRISP-DM: Phases

- **Business Understanding**
Project objectives and requirements understanding, Data mining problem definition
- **Data Understanding**
Initial data collection and familiarization, Data quality problems identification
- **Data Preparation**
Table, record and attribute selection, Data transformation and cleaning
- **Modeling**
Modeling techniques selection and application, Parameters calibration
- **Evaluation**
Business objectives & issues achievement evaluation
- **Deployment**
Result model deployment, Repeatable data mining process implementation

Phases and Tasks

Phase 1. Business Understanding

- **Statement of:**
 - **Business Objective**
 - **Data Mining Objective**
 - **Success Criteria**

Focuses on understanding the project objectives and requirements from a business perspective, then converting this knowledge into a data mining problem definition and a preliminary plan designed to achieve the objectives

Phase 1. Business Understanding

- **Determine business objectives**
 - **thoroughly understand, from a business perspective, what the client really wants to accomplish**
 - **uncover important factors**, at the beginning, that can influence the outcome of the project
 - **neglecting this step is to expend a great deal of effort producing the right answers to the wrong questions**
- **Assess situation**
 - **more detailed fact-finding about all of the resources, constraints, assumptions and other factors that should be considered**
 - **flesh out the details**

Phase 1. Business Understanding

- **Determine data mining goals**

- a business goal states **objectives in business terminology**
- a data mining goal states **objectives in technical terms**

A business goal: “Increase catalog sales to existing customers.”

A data mining goal: “Predict how many widgets a customer will buy, given their purchases over the past three years, demographic information (age, salary, city) and the price of the item.”

- **Produce project plan**

- **describe the intended plan** for achieving the data mining goals and the business goals
- the plan should **specify the anticipated set of steps to be performed** during the rest of the project including an initial selection of tools and techniques

Phase 2. Data Understanding

- **Explore the Data**
- **Verify the Quality**
- **Find Outliers**

Starts with an initial data collection and proceeds with activities in order to get familiar with the data, to identify data quality problems, to discover first insights into the data or to detect interesting subsets to form hypotheses for hidden information.

Phase 2. Data Understanding

- **Collect initial data**

- **acquire within the project the data listed** in the project resources
- includes data loading if necessary for data understanding
- possibly **leads to initial data preparation steps**
- if acquiring multiple data sources, integration is an additional issue, either here or in the later data preparation phase

- **Describe data**

- **examine the “gross” or “surface” properties of the acquired data**
- **report on the results**

Phase 2. Data Understanding

- **Explore data**

- **tackles the data mining questions, which can be addressed using querying, visualization and reporting including:**
 - distribution of key attributes, through aggregations
 - relations between pairs of attributes
 - properties of significant sub-populations
- **may address directly the data mining goals**
- **may contribute to data description and quality reports**
- **may feed into the transformation and other data preparation needed**

- **Verify data quality**

- **examine the quality of the data, addressing questions such as: “Is the data complete?”, Are there missing values in the data?”**

Phase 3. Data Preparation

- **Select data**

- **decide on the data to be used** for analysis
- **criteria include relevance to the data mining goals, quality and technical constraints** such as limits on data volume or data types
- **covers selection of attributes as well as selection of records in a table**

- **Clean data**

- **raise the data quality to the level required** by the selected analysis techniques
- **may involve selection of clean subsets of the data, the insertion of suitable defaults or more ambitious techniques such as the estimation of missing data** by modeling

Phase 3. Data Preparation

- **Construct data**

- **constructive data preparation operations such as the production of derived attributes, entire new records or transformed values for existing attributes**

- **Integrate data**

- **methods whereby information is combined from multiple tables or records to create new records or values**

- **Format data**

- **formatting transformations refer to primarily syntactic modifications made to the data that do not change its meaning, but might be required by the modeling tool**

Phase 4. Modeling

- **Select the modeling technique**
(based upon data mining objectives)
- **Build model**
(Parameter settings)
- **Assess model (rank the models)**

Various modeling techniques are selected and applied and their parameters are calibrated to optimal values. Some techniques have specific requirements on the form of data. Therefore, **stepping back to the data preparation phase is often necessary.**

Phase 4. Modeling

- **Select modeling technique**

- **select the actual modeling technique that is to be used**

ex) decision tree, neural network

- **if multiple techniques are applied, perform this task for each technique separately**

- **Generate test design**

- **before actually building a model, generate a procedure or mechanism to test the model's quality and validity**

ex) In classification, it is common to use error rates as quality measures for data mining models. Therefore, typically separate the dataset into train and test set, **build the model on the train set and estimate its quality on the separate test set**

Phase 4. Modeling

- **Build model**

- **run the modeling tool on the prepared dataset to create one or more models**

- **Assess model**

- **interprets the models** according to his domain knowledge, the data mining success criteria and the desired test design
- **judges the success of the application of modeling and discovery techniques** more technically
- **contacts business analysts and domain experts later in order to discuss the data mining results in the business context**
- **only consider models** whereas the evaluation phase also takes into account all other results that were produced in the course of the project

Phase 5. Evaluation

- **Evaluation of model**
 - how well it performed on test data
- **Methods and criteria**
 - depend on model type
- **Interpretation of model**
 - importance and hardness depend on the algorithm

Thoroughly **evaluate the model** and **review the steps executed to construct the model** to be certain it properly achieves the business objectives. A key objective is **to determine if there is some important business issue that has not been sufficiently considered**. At the end of this phase, a decision on the use of the data mining results should be reached

Phase 5. Evaluation

- **Evaluate results**
 - **assesses the degree to which the model meets the business objectives**
 - **seeks to determine if there is some business reason why this model is deficient**
 - **test the model(s) on test applications in the real application if time and budget constraints permit**
 - **also assesses other data mining results generated**
 - **unveil additional challenges, information or hints for future directions**

Phase 5. Evaluation

- **Review process**

- **do a more thorough review of the data mining engagement** in order to determine if there is any important factor or task that has somehow been overlooked
- **review the quality assurance issues**
ex) “Did we correctly build the model?”

- **Determine next steps**

- **decides how to proceed at this stage**
- **decides whether to finish the project and move on to deployment if appropriate or whether to initiate further iterations or set up new data mining projects**
- **include analyses of remaining resources and budget that influences the decisions**

Phase 6. Deployment

- Determine **how** the results need to be utilized
- **Who** needs to use them?
- **How often** do they need to be used
- Deploy Data Mining results

The knowledge gained will need to **be organized and presented in a way that the customer can use it**. However, **depending on the requirements**, the deployment phase can be as simple as generating a report or as complex as implementing a repeatable data mining process across the enterprise.

Phase 6. Deployment

- **Plan deployment**

- in order to deploy the data mining result(s) into the business, **takes the evaluation results and concludes a strategy for deployment**
- **document the procedure** for later deployment

- **Plan monitoring and maintenance**

- important if the data mining results become part of the day-to-day business and its environment
- **helps to avoid unnecessarily long periods of incorrect usage of data mining results**
- needs a detailed monitoring process
- takes into account the specific type of deployment

Phase 6. Deployment

- **Produce final report**

- the project leader and his team **write up a final report**
- may be only a summary of the project and its experiences
- may be a final and comprehensive presentation of the data mining result(s)

- **Review project**

- **assess what went right and what went wrong, what was done well and what needs to be improved**

Summary

- **Why CRISP-DM?**

The data mining process **must be reliable and repeatable by people with little data mining skills**

CRISP-DM provides a uniform framework for

- guidelines
- experience documentation

CRISP-DM is flexible to account for differences

- Different business/agency problems
- Different data
