

# AIR MILES

a case-study on customer  
segmentation

From: G. Saarevirta, "Mining customer data"  
DB2 magazine on line, 1998

[http://www.db2mag.com/db\\_area/archives/1998/q3/98fsaar.shtml](http://www.db2mag.com/db_area/archives/1998/q3/98fsaar.shtml)

# Customer clustering & segmentation

- ◆ two of the most important data mining methodologies used in marketing
- ◆ use customer-purchase transaction data to
  - track buying behavior
  - create strategic business initiatives.
  - divide customers into segments based on "shareholder value" variables:
    - ◆ customer profitability,
    - ◆ measure of risk,
    - ◆ measure of the lifetime value of a customer,
    - ◆ retention probability.

# Customer segments

## ◆ Example: high-profit, high-value, and low-risk customers

- typically 10% to 20% of customers who create 50% to 80% of a company's profits
- strategic initiative for the segment is retention

## ◆ A low-profit, high-value, and low-risk customer segment may be also attractive

- strategic initiative for the segment is to increase profitability
- cross-selling (selling new products)
- up-selling (selling more of what customers currently buy)

# Behavioral vs. demographic segments

- ◆ Within behavioral segments, a business may create demographic **subsegments**.
- ◆ Customer demographic data are **not** typically used together with behavioral data to create segments.
- ◆ Demographic (sub)segmenting is used to select appropriate **tactics** (advertising, marketing channels, and campaigns) **to satisfy the strategic behavioral segment initiatives**.

# The Loyalty Group in Canada

- ◆ runs an AIR MILES Reward Program (AMRP) for a coalition of more than 125 companies in all industry sectors - finance, credit card, retail, grocery, gas, telecom.
- ◆ 60% of Canadian households enrolled
- ◆ AMRP is a frequent-shopper program:
  - the consumer collects bonuses that can then redeem for rewards (air travel, hotel accommodation, rental cars, theatre tickets, tickets for sporting events, ...)

# Data capture

- ◆ The coalition partners capture consumer transactions and transmit them to The Loyalty Group, which
- ◆ stores these transactions and uses the data for database marketing initiatives on behalf of the coalition partners.
- ◆ The Loyalty Group data warehouse currently contains
  - more than 6.3 million household records
  - 1 billion transaction records.

# Before data mining

- ◆ The Loyalty Group has employed standard analytical techniques
  - Recency, Frequency, Monetary value (RFM) analysis
  - online analytic processing tools
  - linear statistical methods
- ◆ to analyze the success of the various marketing initiatives undertaken by the coalition and its partners.

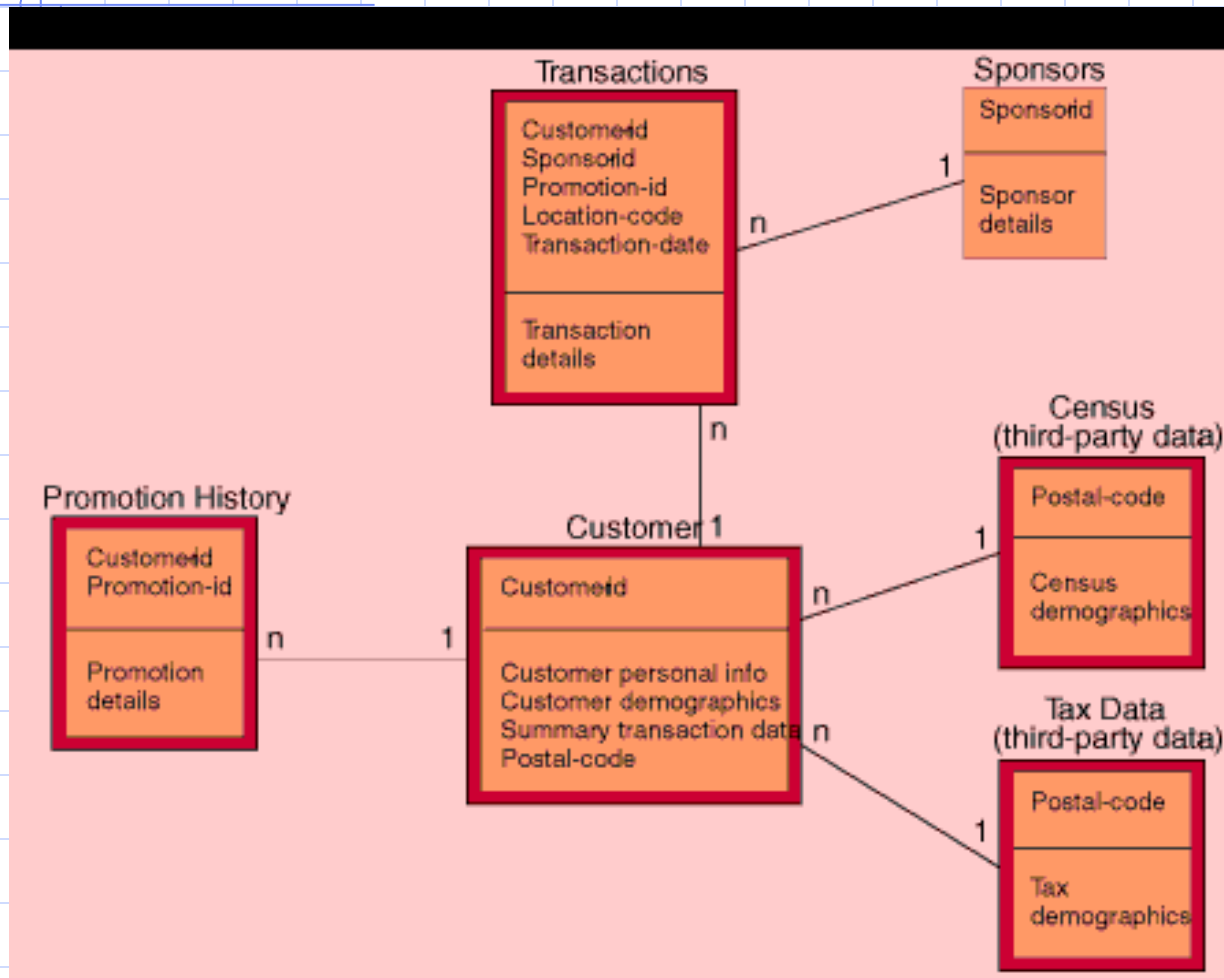

# Data mining project at AMRP

- ◆ Goal: create a customer segmentation using a data mining tool and compare the results to an existing segmentation developed using RFM analysis.
- ◆ data mining platform
  - DB2 Universal Database Enterprise parallelized over a five-node RS/6000 SP parallel system.
  - Intelligent Miner for Data (reason: has categorical clustering and product association algorithms which are not available in most other tools)

# Data model

◆ ~ 50,000 customers and their associated transactions for a 12-month period.

Figure 2. AIR MILES case study data model.

# Data preparation

## ◆ “shareholder value” variables

- revenue (*introito lordo*)
- customer tenure (*lunghezza rapporto con azienda*)
- number of sponsor companies shopped at over the customer tenure
- number of sponsor companies shopped at over the last 12 months,
- recency (in months) of the last transaction

◆ calculated by aggregating the transaction data and adding them to each customer record

# Data preparation (2)

- ◆ Dataset obtained by joining the transaction data to the customer file to create the input for clustering algorithms
- ◆ 84 variables =
  - 14 categories of sponsor companies ×
  - 3 variables per category ×
  - 2 quarters (first two quarters of 1997)

# Data cleansing - missing values

- ◆ demographic data
  - is usually categorical
  - has a high % of missing values
  - the missing values can be set to either **unknown** or **unanswered** (if result of unanswered questions)
- ◆ if a large portion of the field is missing, it may be discarded.
- ◆ In the case study, missing numeric values set to 0

# Data transformation

- ◆ Ratio variables.
  - E.g.:  $\text{profitability} = \text{profit} / \text{tenure}$
- ◆ Time-derivative variables.
  - E.g.:  $\text{profit 2nd quarter} - \text{profit 1st quarter}$
- ◆ Discretization using quantiles.
  - E.g., break points at 10, 25, 50, 75, and 90.
- ◆ Discretization using predefined ranges.
  - E.g., those used in census
- ◆ Log transforms.
  - E.g., for very skewed distributions

# Distribution of original data

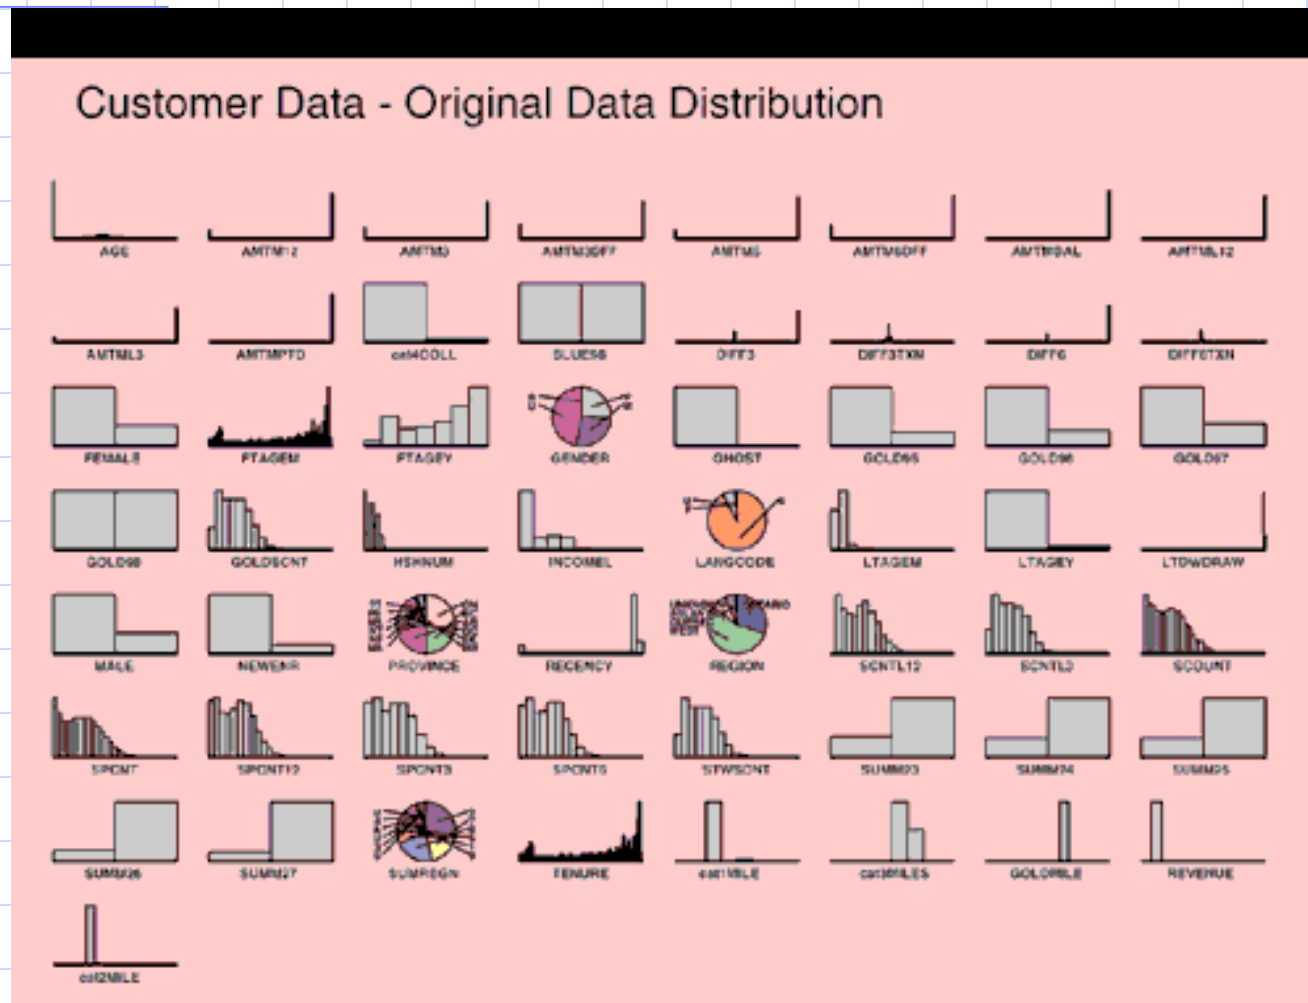

Figure3. Original data.

# Distribution of discretized data

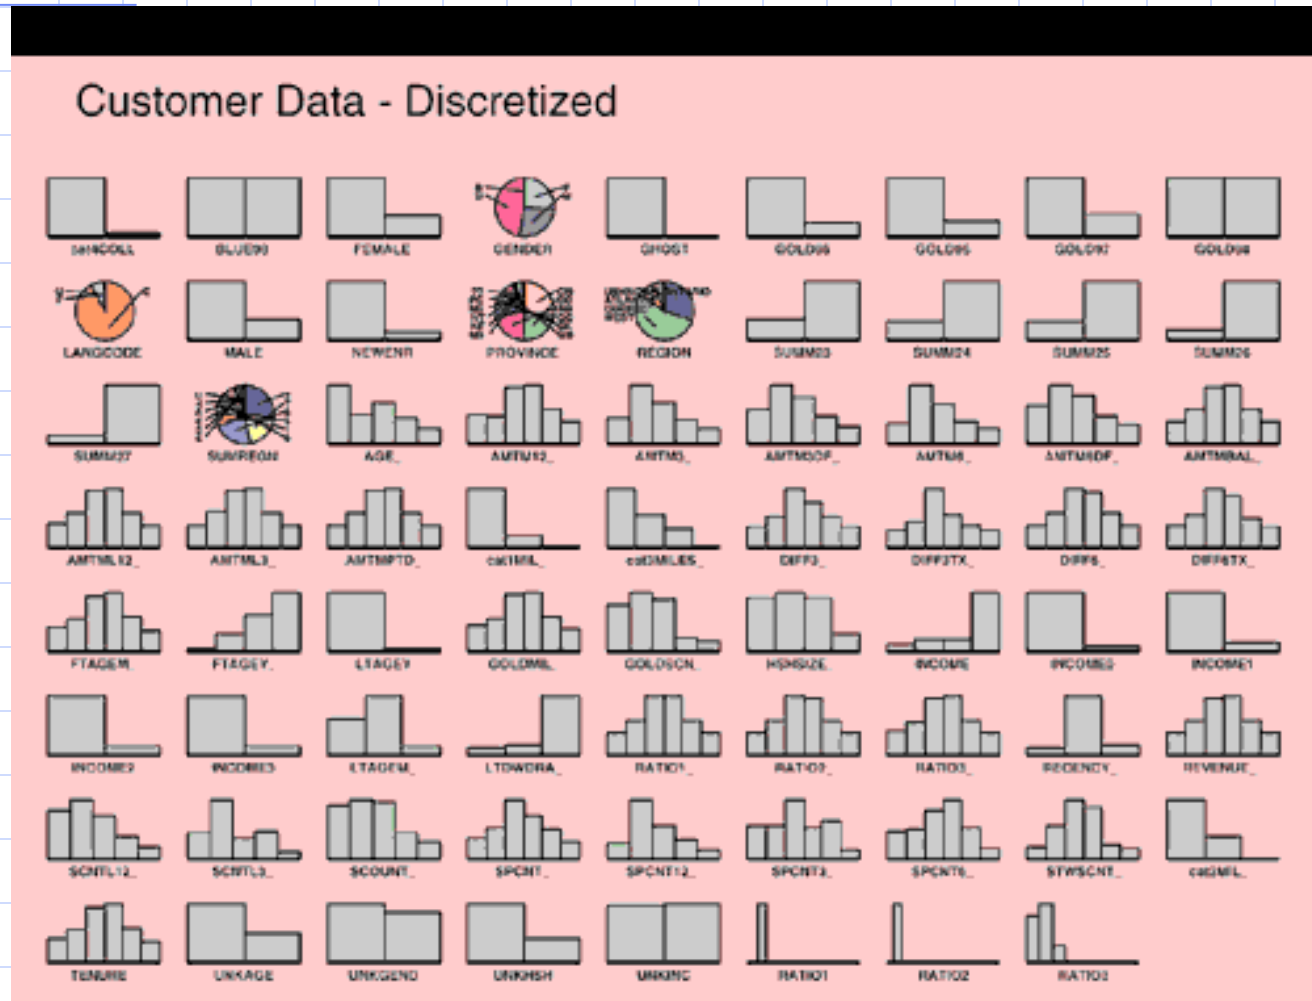

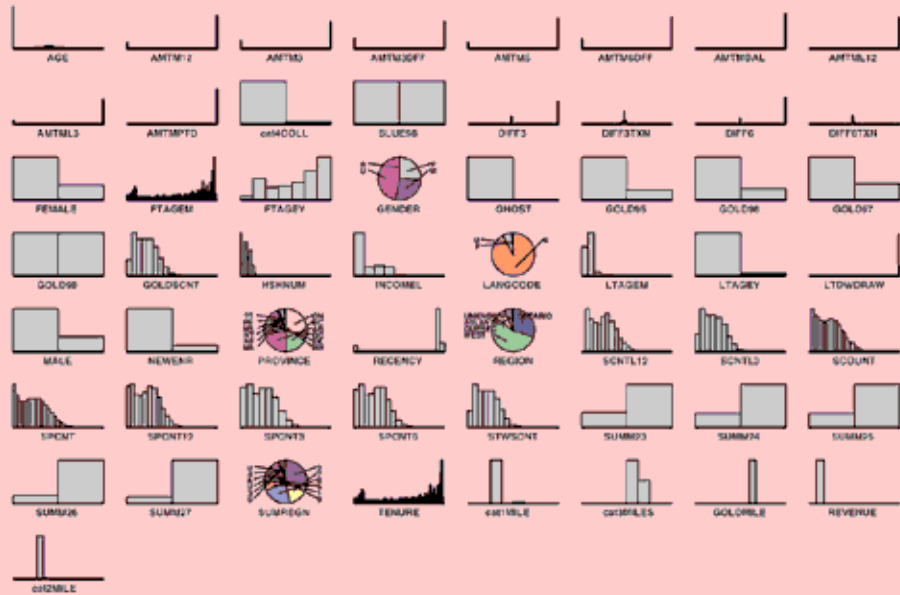

Figure 4. Discretized data.

# Before/after discretization

Customer Data - Original Data Distribution

Customer Data - Discretized

Figure 3. Original data.

Figure 4. Discretized data.

# Clustering/segmentation methodology

**Figure 6.** Clustering workflow.

# IBM-IM demographic clustering

- ◆ Designed for categorical variables
- ◆ Similarity index:
  - increases with number of common values on same attribute
  - decreases with number of different values on same attribute
- ◆ # of clusters is **not fixed a priori**
  - only upper bound set

# IM Demographic clustering

## ◆ basic parameters:

- **Maximum number of clusters.**
- **Maximum number of passes** through the data.
- **Accuracy:** a stopping criterion for the algorithm. If the change in the Condorcet criterion between data passes is smaller than the accuracy (as %), the algorithm will terminate.
- The **Condorcet criterion** is a value in  $[0,1]$ , where 1 indicates a perfect clustering -- all clusters are homogeneous and entirely different from all other clusters

# ... more parameters

## ◆ Similarity threshold.

- defines the similarity threshold between two values in distance units.
- If the similarity threshold is 0.5, then two values are considered equal if their absolute difference is less than or equal to 0.5.

## ◆ In the case study:

- maximum # of clusters: 9
- maximum # of passes: 5
- accuracy: 0.1

# Input dataset

◆ dataset: all continuous variables discretized.

◆ input variables :

- # of products purchased over customer's lifetime
- # of products purchased in the last 12 months
- Customer's revenue contribution over lifetime
- Customer tenure in months
- Ratio of revenue to tenure
- Ratio of number of products to tenure
- Region
- Recency
- Tenure (# of months since customer first enrolled in the program).

# Input dataset

- ◆ Other discrete and categorical variables and some interesting continuous variables were input as **supplementary variables**:
- ◆ variables used to profile the clusters but **not** to define them.
- ◆ easier interpretation of clusters using data other than the input variables.

# Output of demographic clustering

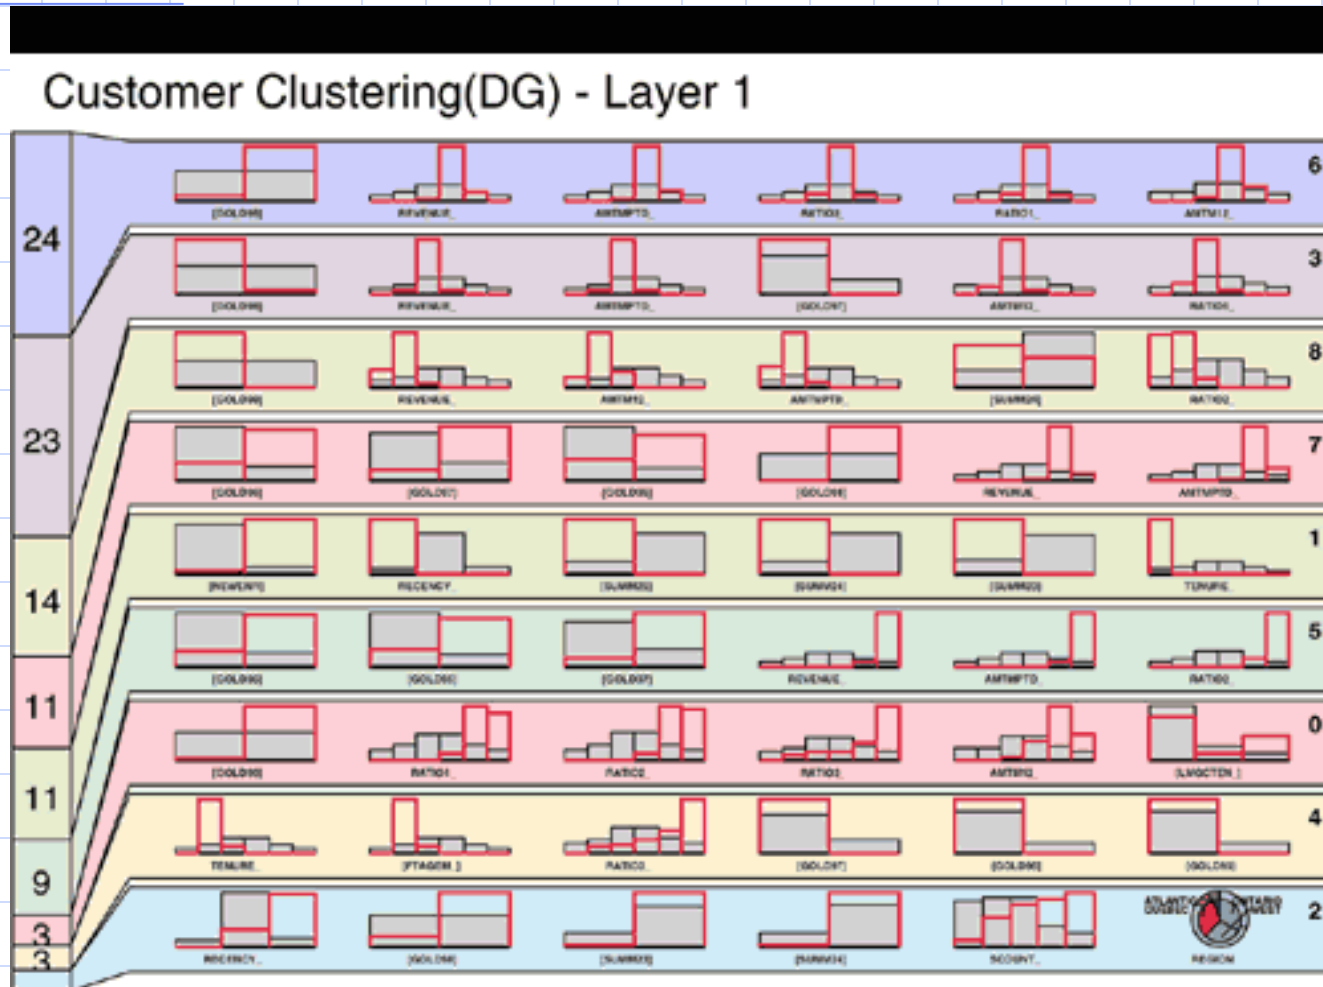

Figure 7. Demographic clustering output.

# Visualization of clusters

- ◆ horizontal strip = a cluster
- ◆ clusters are ordered from top to bottom in order of size
- ◆ variables are ordered from left to right in order of importance to the cluster, based on a chi-square test between variable and cluster ID.
- ◆ other metrics include entropy, Condorcet criterion, and database order.

# Visualization of clusters

- ◆ variables used to define clusters are without brackets, while the supplementary variables appear within brackets.
- ◆ numeric (integer), discrete numeric (small integer), binary, and continuous variables have their frequency distribution shown as a **bar graph**.
- ◆ **red bars** = distribution of the variable within the current cluster.
- ◆ **gray solid bars** = distribution of the variable in the whole universe.

# Visualization of clusters

- ◆ Categorical variables are shown as pie charts.
- ◆ inner pie = distribution of the categories for the current cluster
- ◆ outer ring = distribution of the variable for the entire universe.
- ◆ The more different the cluster distribution is from the average, the more interesting or distinct the cluster.

# Output of demographic clustering

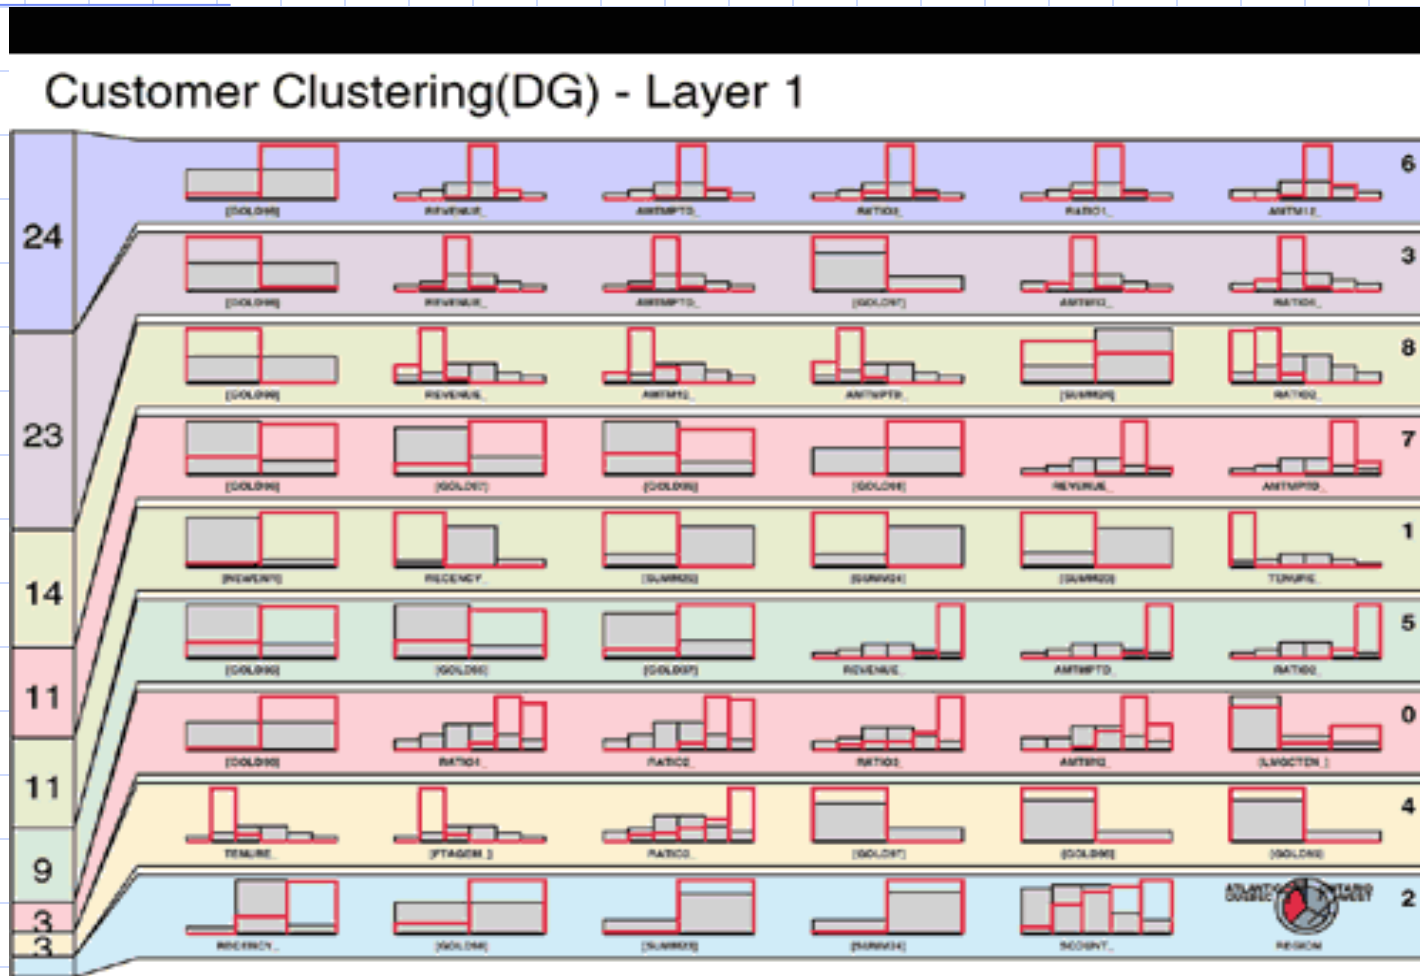

Figure 7. Demographic clustering output.

# Qualitative characterization of clusters

- ◆ **Gold98** is a binary variable that indicates the best customers in the database, created previously by the business using RFM analysis.
- ◆ The clustering model agrees very well with this existing definition: Most of the clusters seem to have almost all Gold or no Gold customers.
- ◆ Confirmed the current Gold segment!

# Qualitative characterization of clusters

## ◆ Our clustering results

- not only validate the existing concept of Gold customers,
- they extend the idea of the Gold customers by creating clusters **within** the Gold98 customer category.
- A **platinum** customer group

## ◆ Cluster 6

- almost all Gold98 customers, whose revenue, bonus collected lifetime to date, revenue per month, and lifetime to date per month are all in the 50th to 75th percentile.

# Qualitative characterization of clusters

## ◆ Cluster 3:

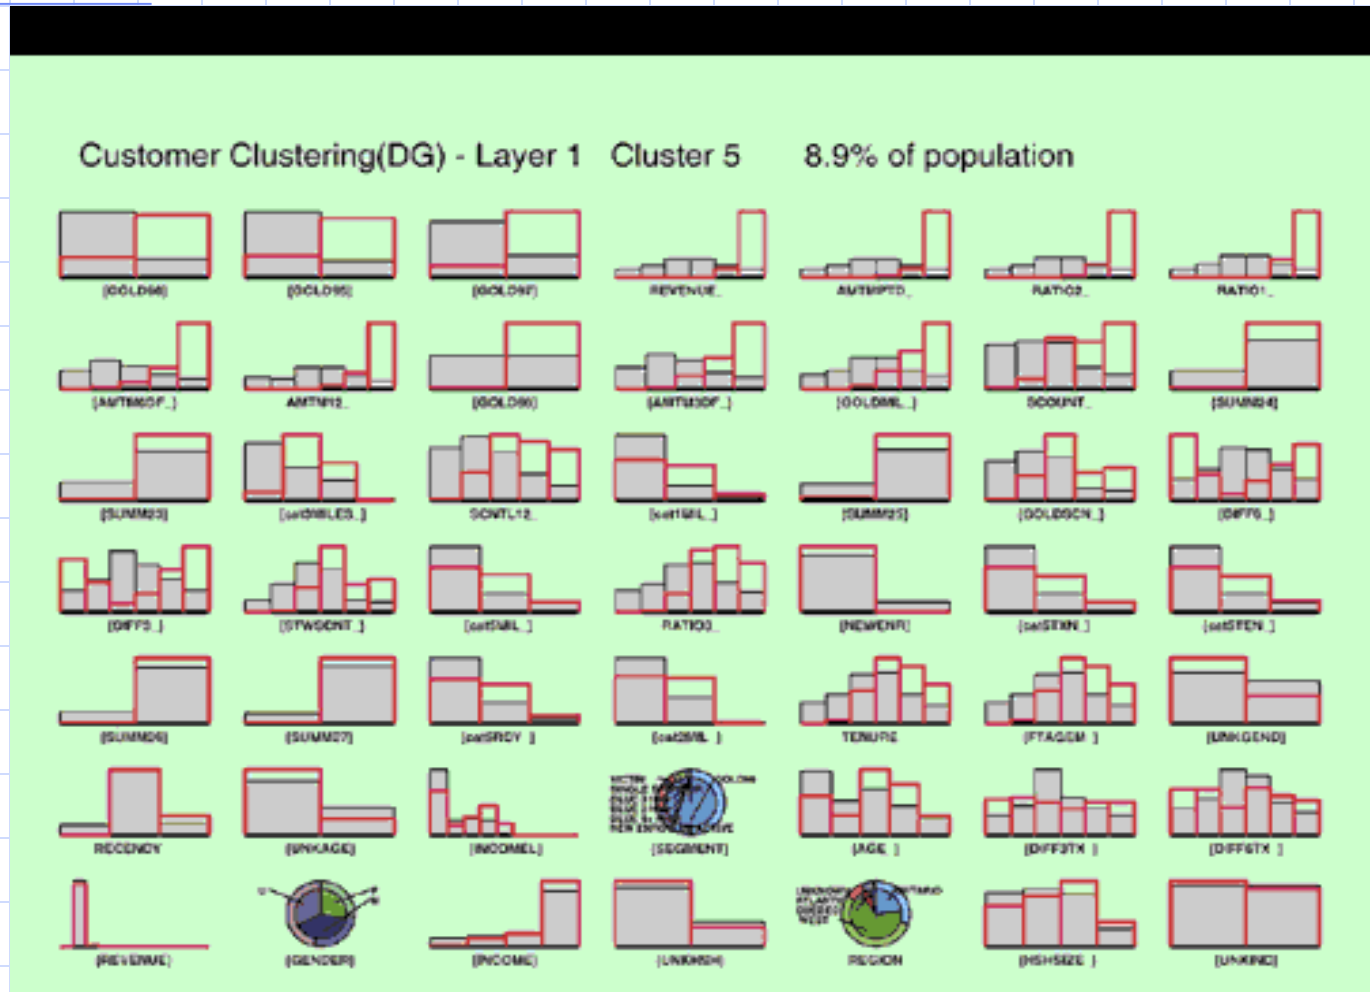

- no Gold98 customers. Its customer revenue, bonus collected, revenue per month, are all in the 25th to 50th percentile.

## ◆ Cluster 5:

- 9 %of the population.
- revenue, bonus collected are all in the 75th percentile and above, skewed to almost all greater than the 90th percentile.
- looks like a very profitable cluster

# Detailed view of cluster 5

# Profiling clusters

- ◆ Goal: assess the potential business value of each cluster quantitatively by profiling the aggregate values of the shareholder value variables by cluster.

| CLUSTERID | REVENUE | CUSTOMERS | PRODUCT INDEX | LEVERAGE | TENURE |
|-----------|---------|-----------|---------------|----------|--------|
| 5         | 34.74%  | 8.82%     | 1.77          | 3.94     | 60.92  |
| 6         | 26.13%  | 23.47%    | 1.41          | 1.11     | 57.87  |
| 7         | 21.25%  | 10.71%    | 1.64          | 1.98     | 63.52  |
| 3         | 6.62%   | 23.32%    | .73           | .28      | 47.23  |
| 0         | 4.78%   | 3.43%     | 1.45          | 1.40     | 31.34  |
| 2         | 4.40%   | 2.51%     | 1.46          | 1.75     | 61.38  |
| 4         | 1.41%   | 2.96%     | .99           | .48      | 20.10  |
| 8         | .45%    | 14.14%    | .36           | .03      | 30.01  |
| 1         | .22%    | 10.64%    | .00           | .02      | 4.66   |

**Table 1.** *Profiling a cluster.*

# Profiling clusters

- ◆ **leverage** = ratio of revenue to customer.
- ◆ cluster 5 is the most profitable cluster.
- ◆ as profitability increases, so does the average number of products purchased.
- ◆ **product index** = ratio of the average number of products purchased by the customers in the cluster divided by the average number of products purchased overall.
- ◆ customer profitability increases as tenure increases.

# Business opportunities

- ◆ Best customers in clusters 2, 5, and 7. :
  - indication: **retention**
- ◆ clusters 2, 6, and 0
  - indication: **cross-selling** by contrasting with clusters 5 and 7.
  - Clusters 2, 6, and 0 have a product index close to those of clusters 5 and 7, which have the highest number of products purchased.
  - Try to convert customers from clusters 2, 6, and 0 to clusters 5 and 7. By comparing which products are bought we can find products that are candidates for cross-selling.

# Business opportunities

## ◆ Clusters 3 and 4

- indication: **cross-selling** to clusters 2, 6, and 0 •

## ◆ Cluster 1

- indication: **wait and see**. It appears to be a group of new customers

## ◆ Cluster 8

- indication: **no waste of marketing dollars**

# Follow-up

## ◆ Reactions from The Loyalty Group

- visualization of results allowed for meaningful and actionable analysis.
- original segmentation methodology validated, but that refinements to the original segmentation could prove valuable.
- decision to undertake further data mining projects, including
  - ◆ predictive models for direct mail targeting,
  - ◆ further work on segmentation using more detailed behavioral data,
  - ◆ opportunity identification using **association algorithms** within the segments discovered.

# Demographic clustering: parameters

|                  | $w_1$ | $w_2$ | ... | $w_m$ |   |   |   |   |   |   |   |   |
|------------------|-------|-------|-----|-------|---|---|---|---|---|---|---|---|
| Doc <sub>i</sub> | 1     | 1     | 1   | 0     | 1 | 1 | 0 | 1 | 0 | 1 | 0 |   |
| Doc <sub>j</sub> | 1     | 0     | 0   | 1     | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 |

$$N_{11} = \sum_{k=1}^m x_{ik} x_{jk}$$

$$N_{10} = \sum_{k=1}^m x_{ik} (1-x_{jk})$$

$$N_{01} = \sum_{k=1}^m (1-x_{ik}) x_{jk}$$

$$N_{00} = \sum_{k=1}^m (1-x_{ik}) (1-x_{jk})$$

## Indice di Somiglianza

$$s(i,j) = \frac{a N_{11}}{b N_{11} + c (N_{10} + N_{01})}$$

• Condorcet  $a=b=1$   $c=1/2$

• Dice  $a=b=1$   $c=1/4$

## Soglia di Somiglianza

se  $s(i,j) > \alpha$  Doc<sub>i</sub> e Doc<sub>j</sub> sono simili

$\alpha$  in  $[0,1]$

• default:  $\alpha = 0.5$

## Sistema di ponderazione

$$N_{11} = \sum_{k=1}^m x_{ik} x_{jk} w_k \quad (N_{10} = \dots \quad N_{01} = \dots)$$

•  $w_k = 1 / x_k$

•  $w_k = \log(N / x_k)$

# Demographic clustering: similarity index

- ◆ proportional to 1-1
- ◆ inversely proportional to 0-1 and 1-0
- ◆ unaffected by 0-0
- ◆ Condorcet index=
  - $N_{11} / (N_{11} + \frac{1}{2}(N_{01} + N_{10}))$
- ◆ Dice index=
  - $N_{11} / (N_{11} + \frac{1}{4}(N_{01} + N_{10}))$
- ◆ Dice looser than Condorcet
  - appropriate with highly different objects

# Demographic clustering: similarity index

- ◆ Similarity threshold  $\alpha$ 
  - $i, j$  assumed similar if  $s(i, j) > \alpha$
  - low values ( $< 0.5$ ) appropriate with highly different objects
- ◆ Weights for attributes
  - importance of attributes in the similarity index may be varied with different weights
  - default weight = 1
