Principles for Software Composition

Roberto Bruni

<http://www.di.unipi.it/~bruni/>

21 - CCS at work

CCS syntax

p, q	$::=$	nil	inactive process
		x	process variable (for recursion)
		$\mu.p$	action prefix
		$p \backslash \alpha$	restricted channel
		$p[\phi]$	channel relabelling
		$p + q$	nondeterministic choice (sum)
		$p q$	parallel composition
		rec $x.$ p	recursion

(operators are listed in order of precedence)

Some notation

write $\sum_{i=1}^n p_i$ instead of $p_1 + \cdots + p_n$

write $\prod_{i=1}^n p_i$ instead of $p_1 | \cdots | p_n$

write $p \setminus \{a_1, \dots, a_n\}$ instead of $p \setminus a_1 \cdots \setminus a_n$

write $\mu^n.p$ instead of $\underbrace{\mu.\mu\dots\mu.}_n p$

CCS op. semantics

$$\text{Act)} \frac{}{\mu.p \xrightarrow{\mu} p} \quad \text{Res)} \frac{p \xrightarrow{\mu} q \quad \mu \notin \{\alpha, \bar{\alpha}\}}{p\backslash\alpha \xrightarrow{\mu} q\backslash\alpha} \quad \text{Rel)} \frac{p \xrightarrow{\mu} q}{p[\phi] \xrightarrow{\phi(\mu)} q[\phi]}$$

$$\text{SumL)} \frac{p_1 \xrightarrow{\mu} q}{p_1 + p_2 \xrightarrow{\mu} q} \quad \text{SumR)} \frac{p_2 \xrightarrow{\mu} q}{p_1 + p_2 \xrightarrow{\mu} q}$$

$$\text{ParL)} \frac{p_1 \xrightarrow{\mu} q_1}{p_1 | p_2 \xrightarrow{\mu} q_1 | p_2} \quad \text{Com)} \frac{p_1 \xrightarrow{\lambda} q_1 \quad p_2 \xrightarrow{\bar{\lambda}} q_2}{p_1 | p_2 \xrightarrow{\tau} q_1 | q_2} \quad \text{ParR)} \frac{p_2 \xrightarrow{\mu} q_2}{p_1 | p_2 \xrightarrow{\mu} p_1 | q_2}$$

$$\text{Rec)} \frac{p[x/\text{rec } x. \ p] \xrightarrow{\mu} q}{\text{rec } x. \ p \xrightarrow{\mu} q}$$

CCS
Encoding imperative languages

Preliminaries: termination

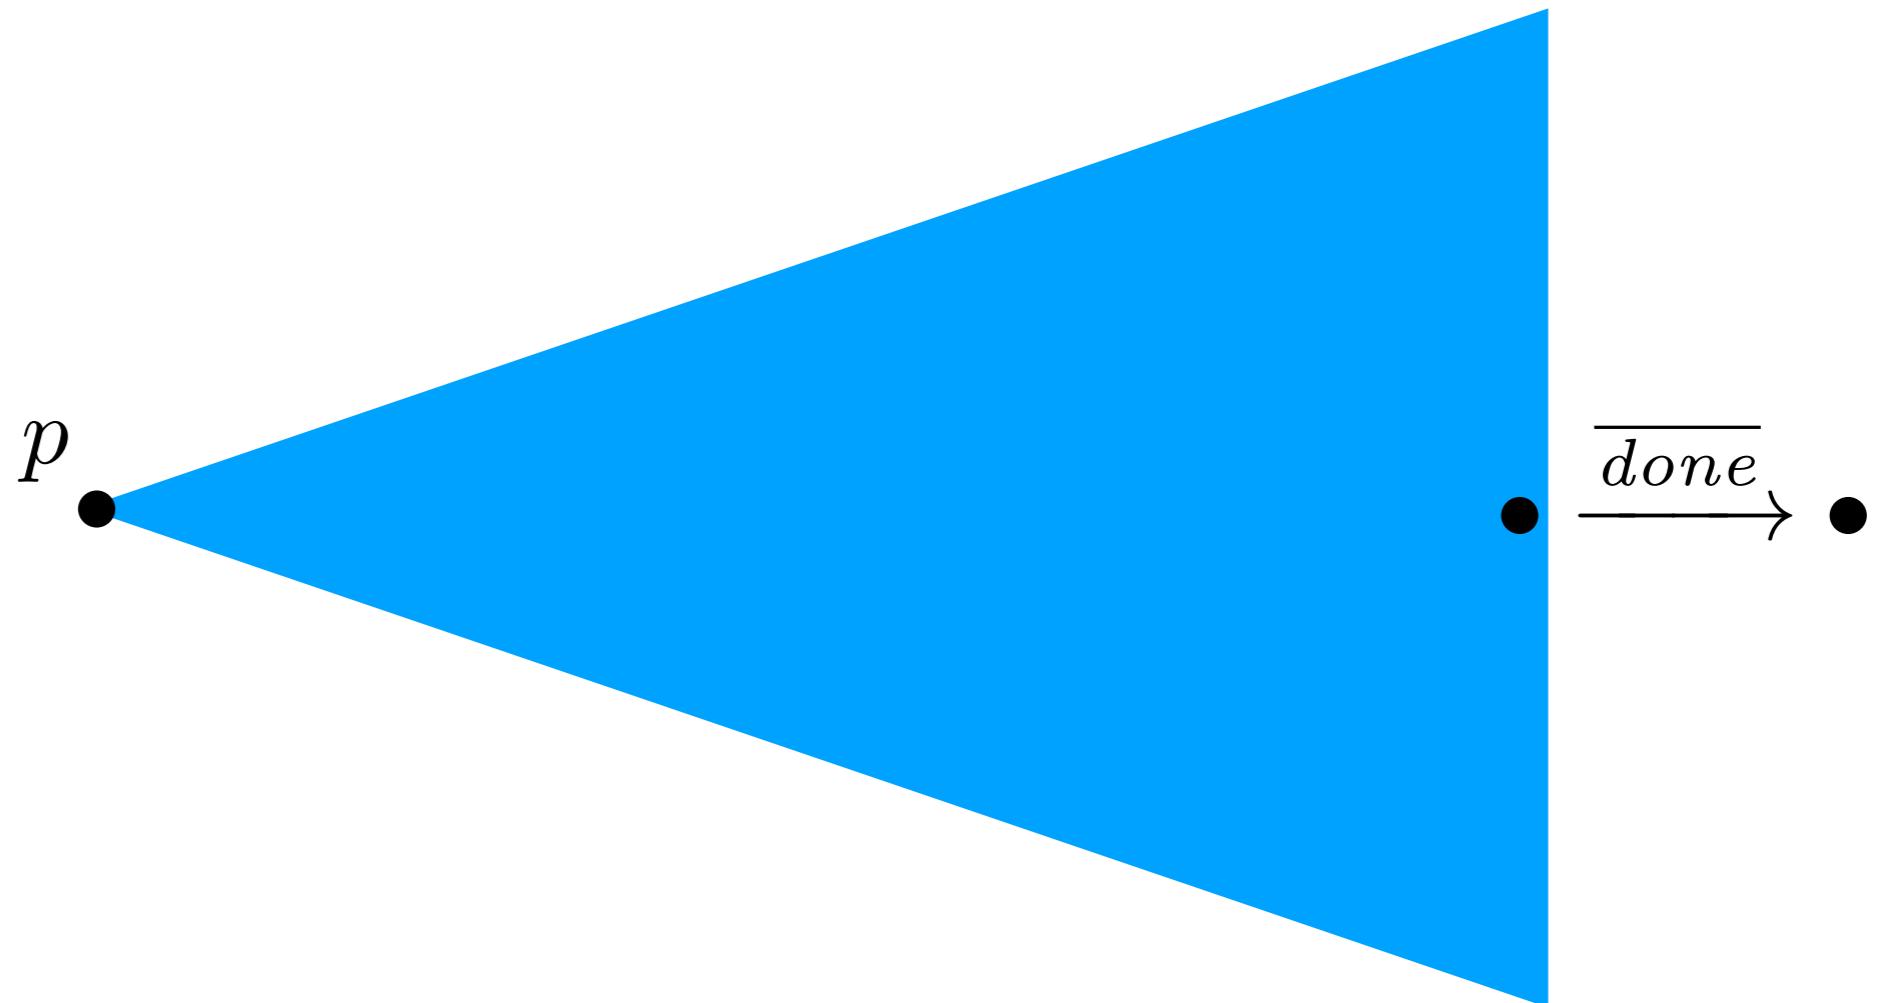

A dedicated channel *done*:

a message is sent when the current command terminates

$$\text{Done} \triangleq \overline{\text{done}}$$

$$\text{Done} \xrightarrow{\overline{\text{done}}} \text{nil}$$

Termination

Skip

skip

does nothing and sends *done*

$\tau.\text{Done}$

- $\xrightarrow{\tau} \text{Done} \xrightarrow{\overline{\text{done}}} \text{nil}$

Variables

x ranging over $V = \{v_1, \dots, v_n\}$

a dedicated process for managing each variable

we can read its current value (channel xr_i)

we can write any value (channel xw_i)

$$\begin{aligned} XW &\triangleq \sum_{i=1}^n xw_i.X_i \\ &= xw_1.X_1 + \cdots + xw_n.X_n \end{aligned}$$

$$X_i \triangleq \overline{xr}_i.X_i + XW$$

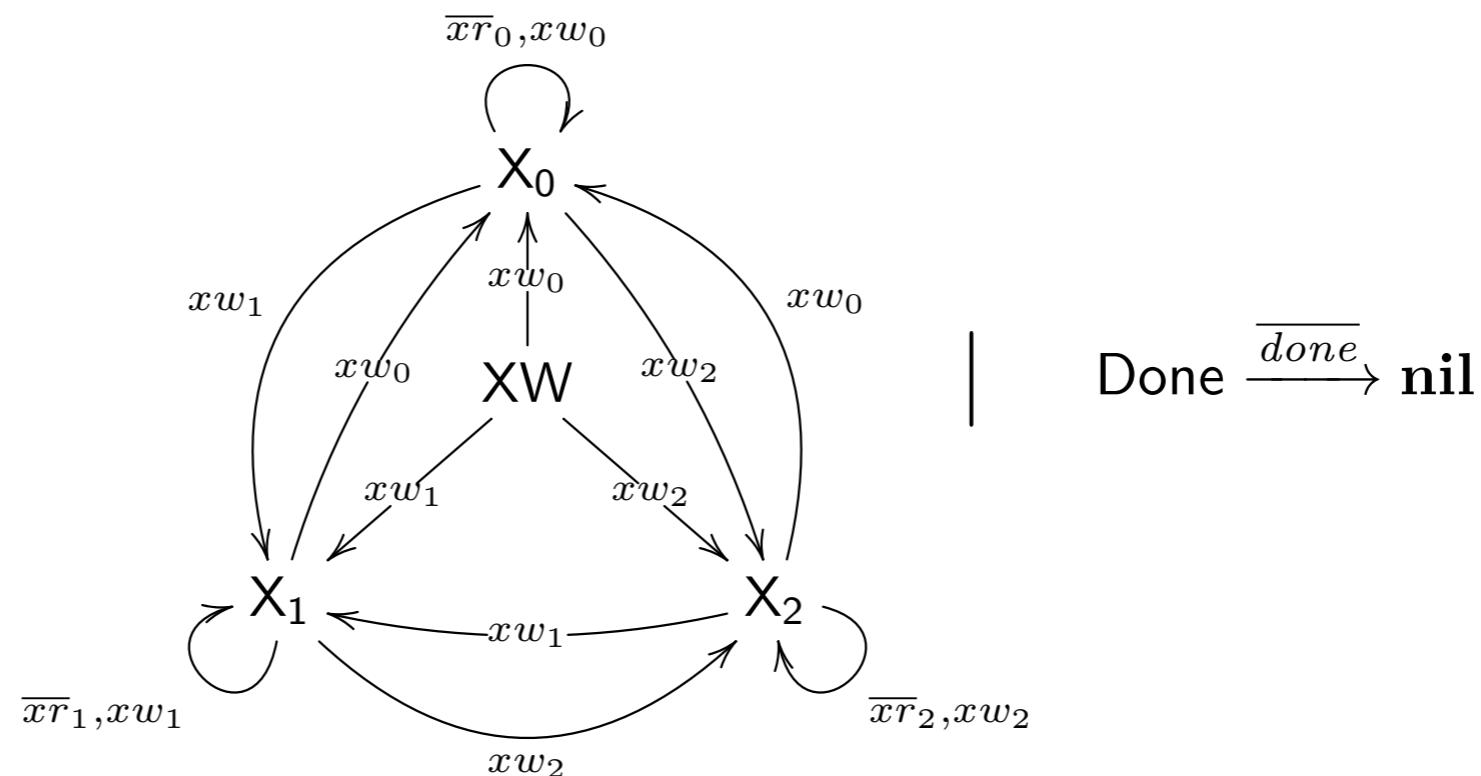

Variable declaration

var x

releases an uninitialised variable and terminates

XW|Done

$$V = \{v_0, v_1, v_2\}$$

Assignment

$x := v_i$

sends a message to change the state of the variable
and then terminates

$\overline{xw}_i.\text{Done}$

- $\xrightarrow{\overline{xw}_i} \text{Done} \xrightarrow{\overline{\text{done}}} \text{nil}$

Sequential composition

$c_1 ; c_2$

suppose p_1 models c_1
 p_2 models c_2

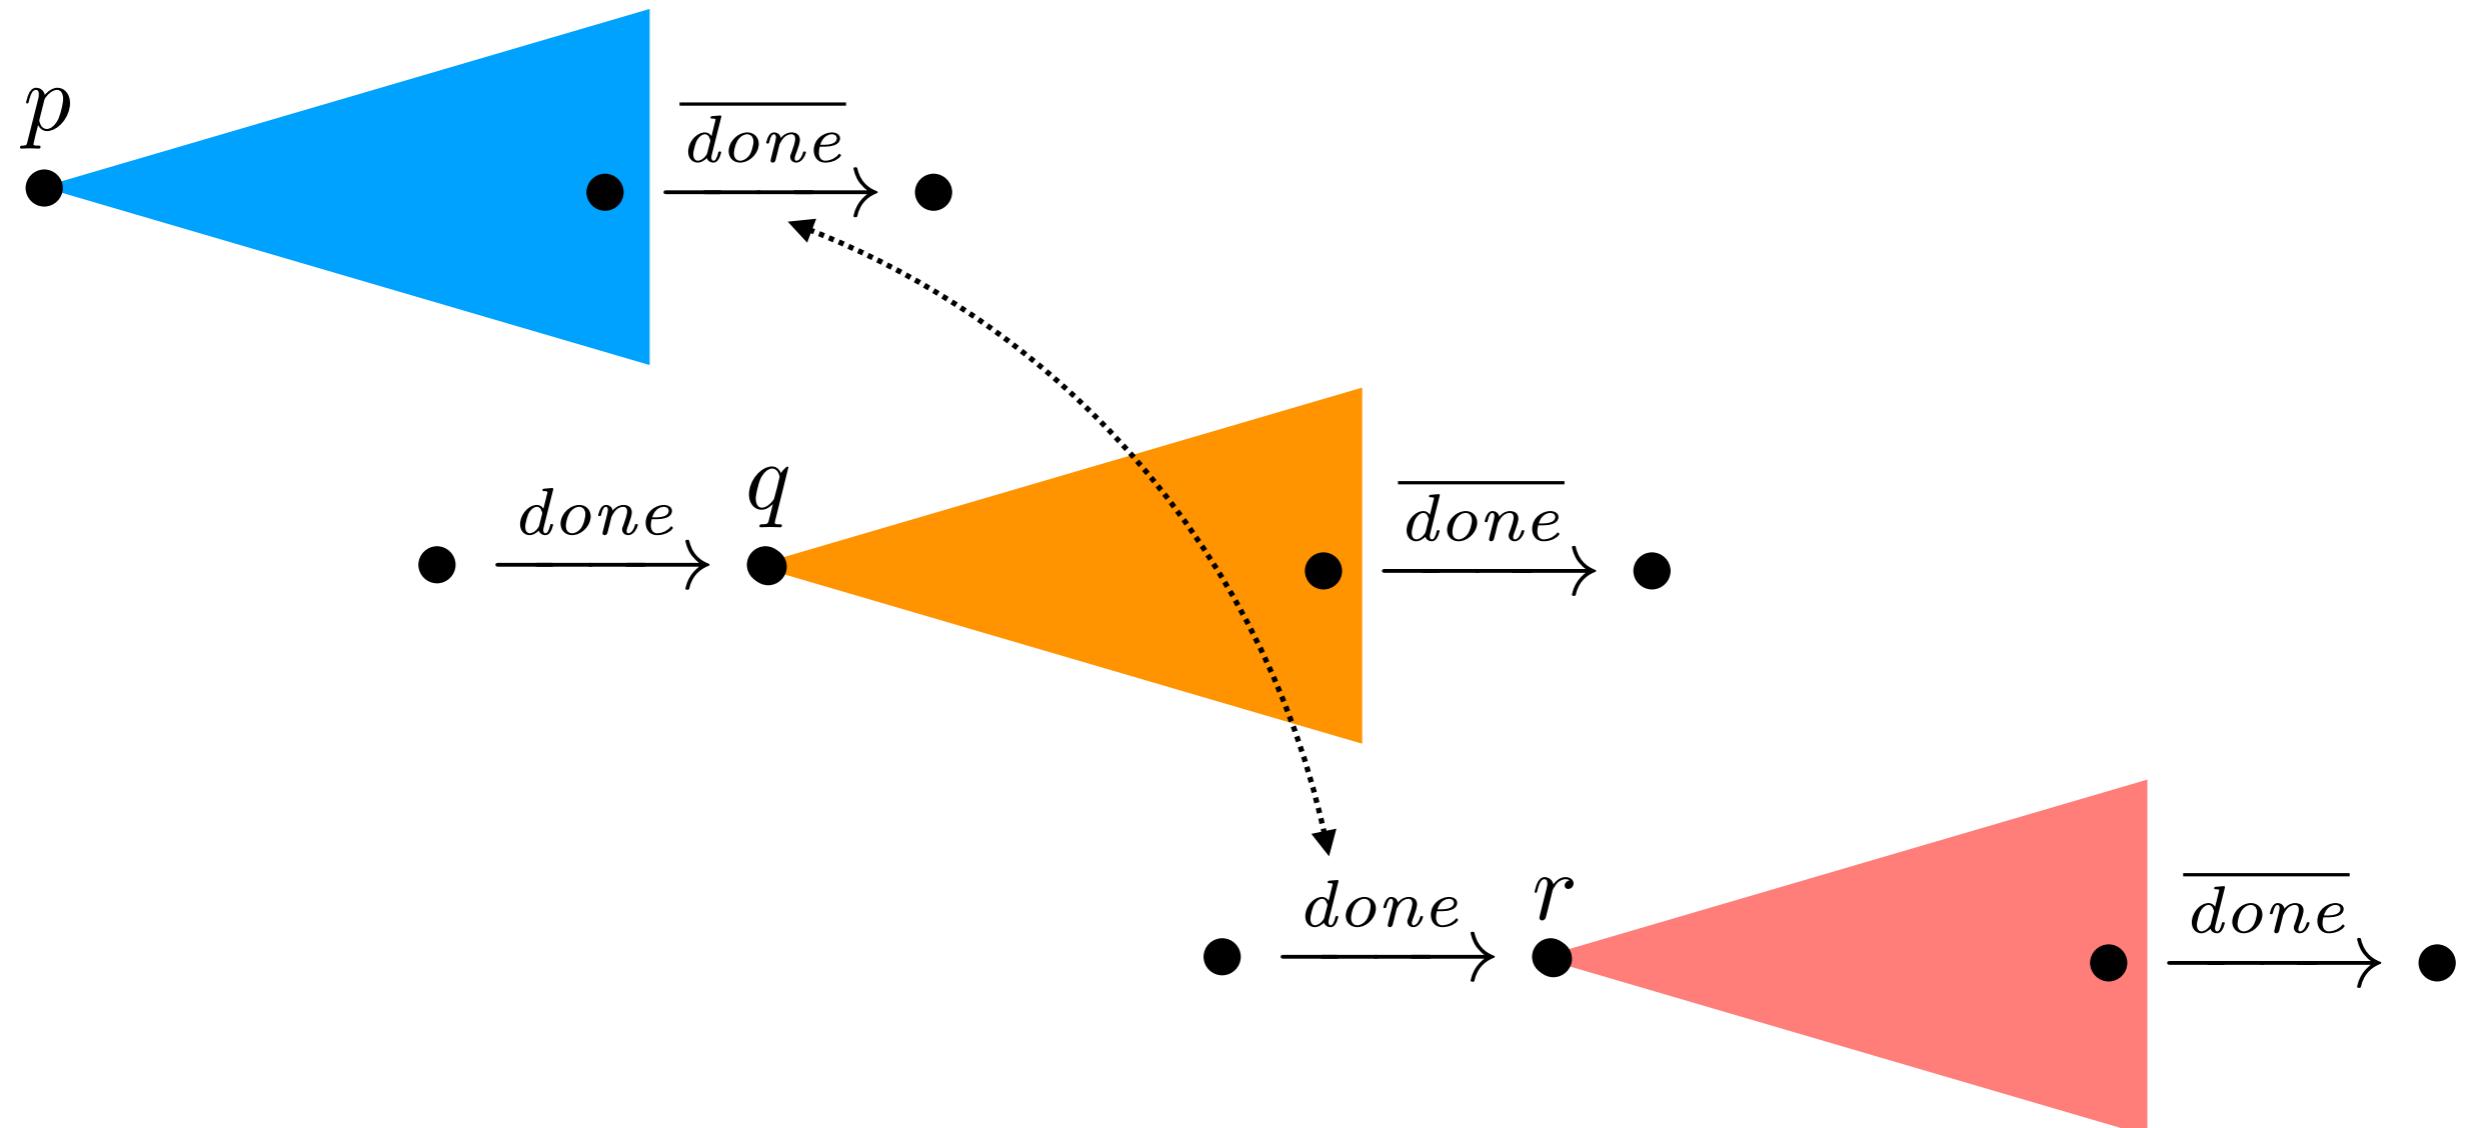

$p_1 | done . p_2$

unfortunate choice: does not scale

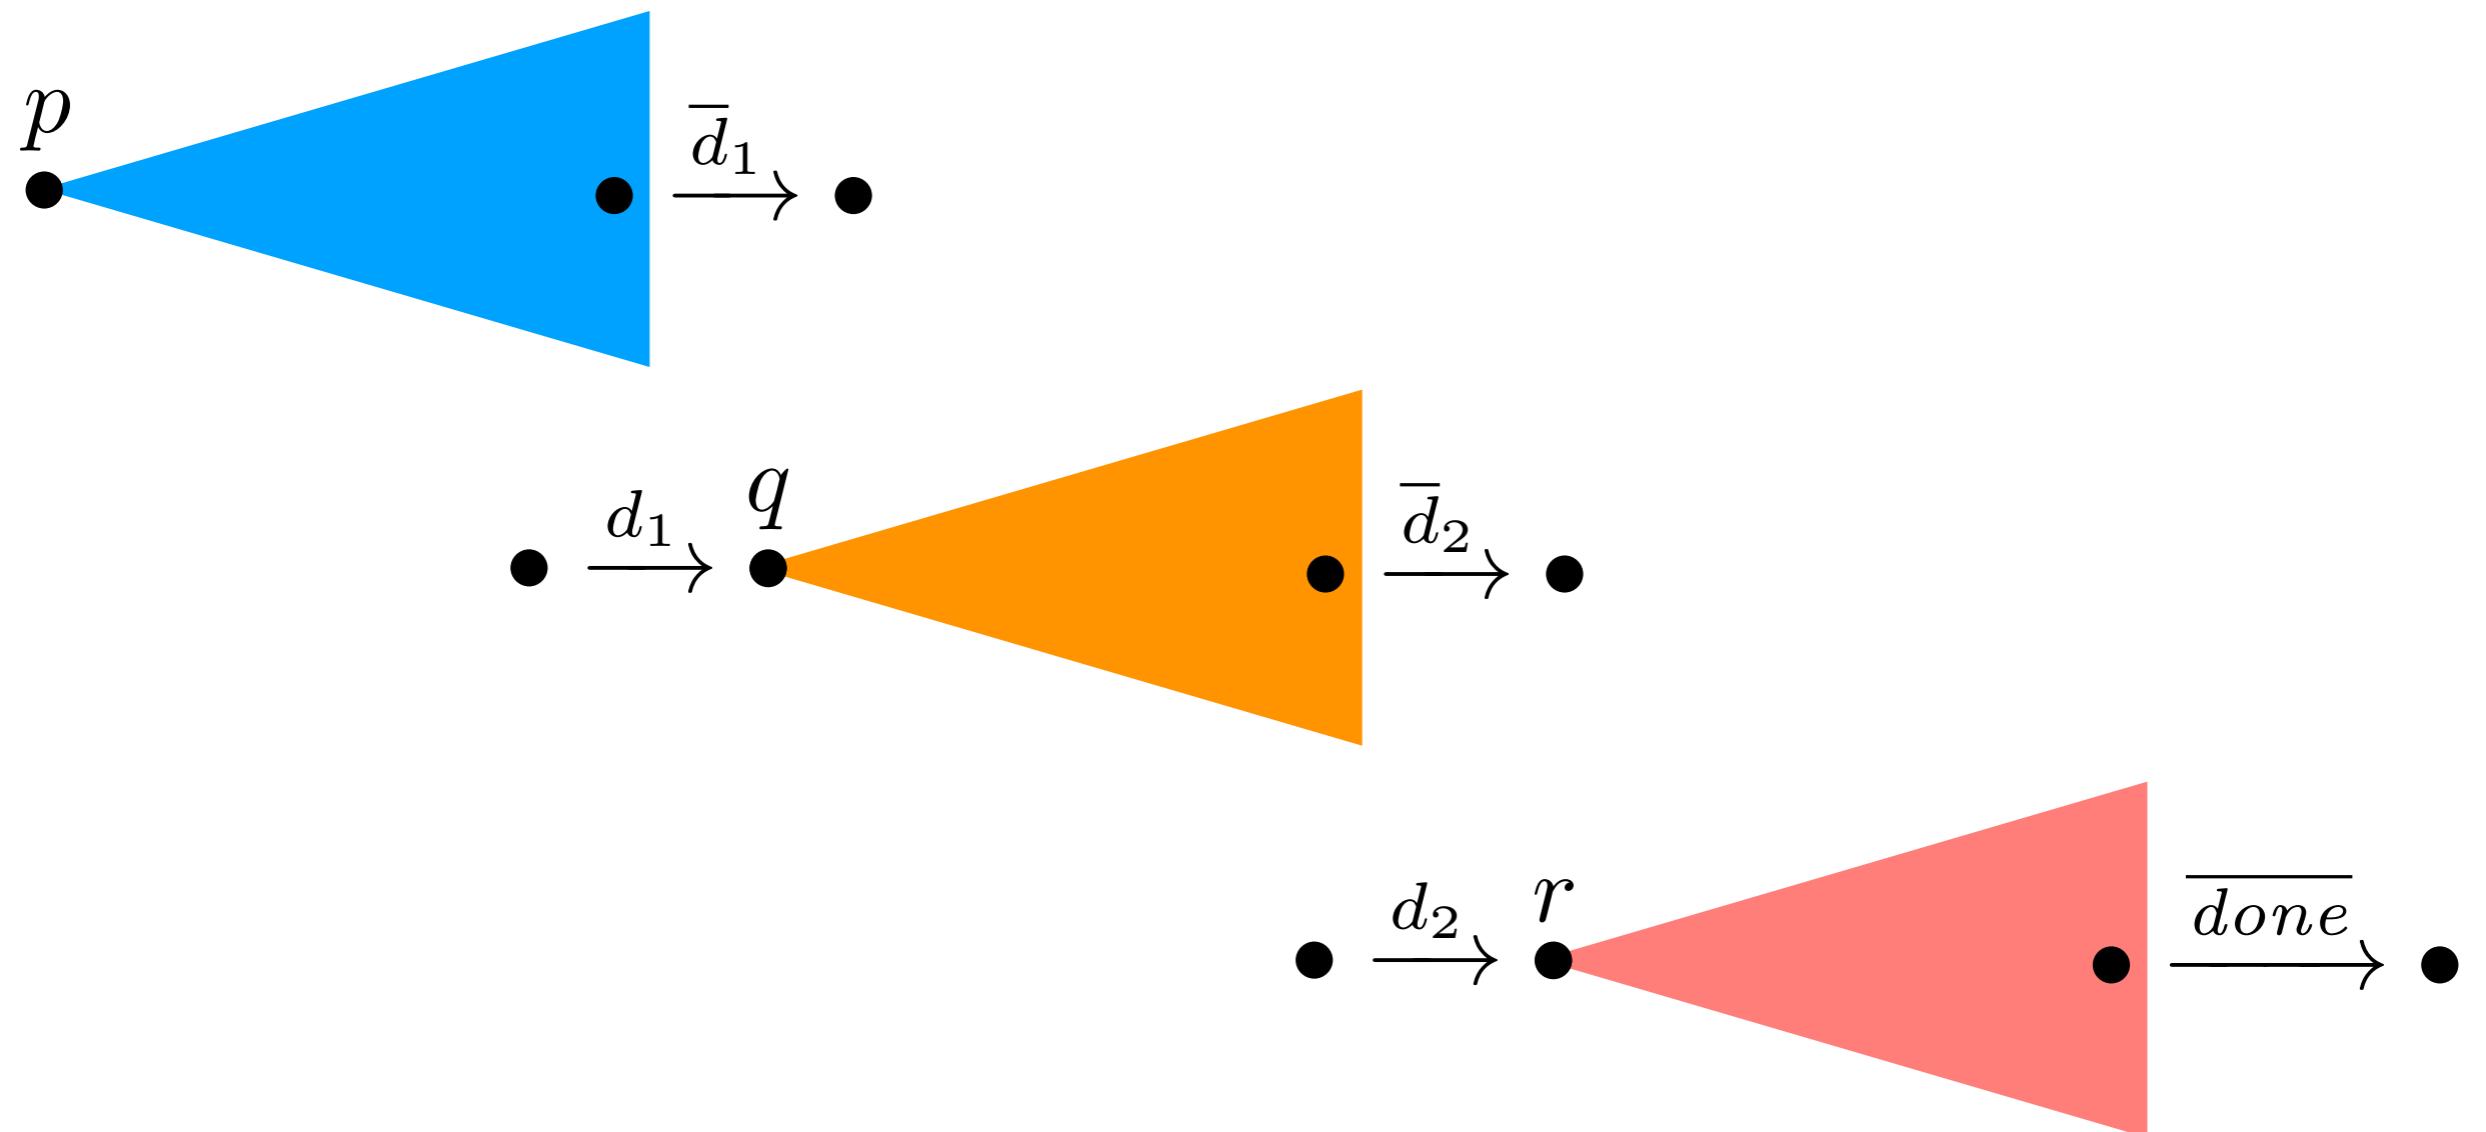

$c_1 ; c_2 ; c_3$
 $p_1 | done . p_2 | done . p_3$

p_3 can start after p_1

Sequential?

Sequential!

Sequential composition

$c_1 ; c_2$

suppose

$$\begin{array}{ll} p_1 \text{ models } c_1 & \phi_d(\text{done}) = d \\ p_2 \text{ models } c_2 & \end{array}$$

$$p_1 \frown p_2 \triangleq (p_1[\phi_d] | d.p_2) \setminus d$$

now d is local to p_1 and p_2

$$((p_1[\phi_{d_1}] | d_1.p_2) \setminus d_1)[\phi_{d_2}] | d_2.p_3) \setminus d_2$$

$$((p_1[\phi_d] | d.p_2) \setminus d)[\phi_d] | d.p_3) \setminus d$$

$$(p_1 \frown p_2) \frown p_3$$

Conditional

if $x = v_i$ then c_1 else c_2

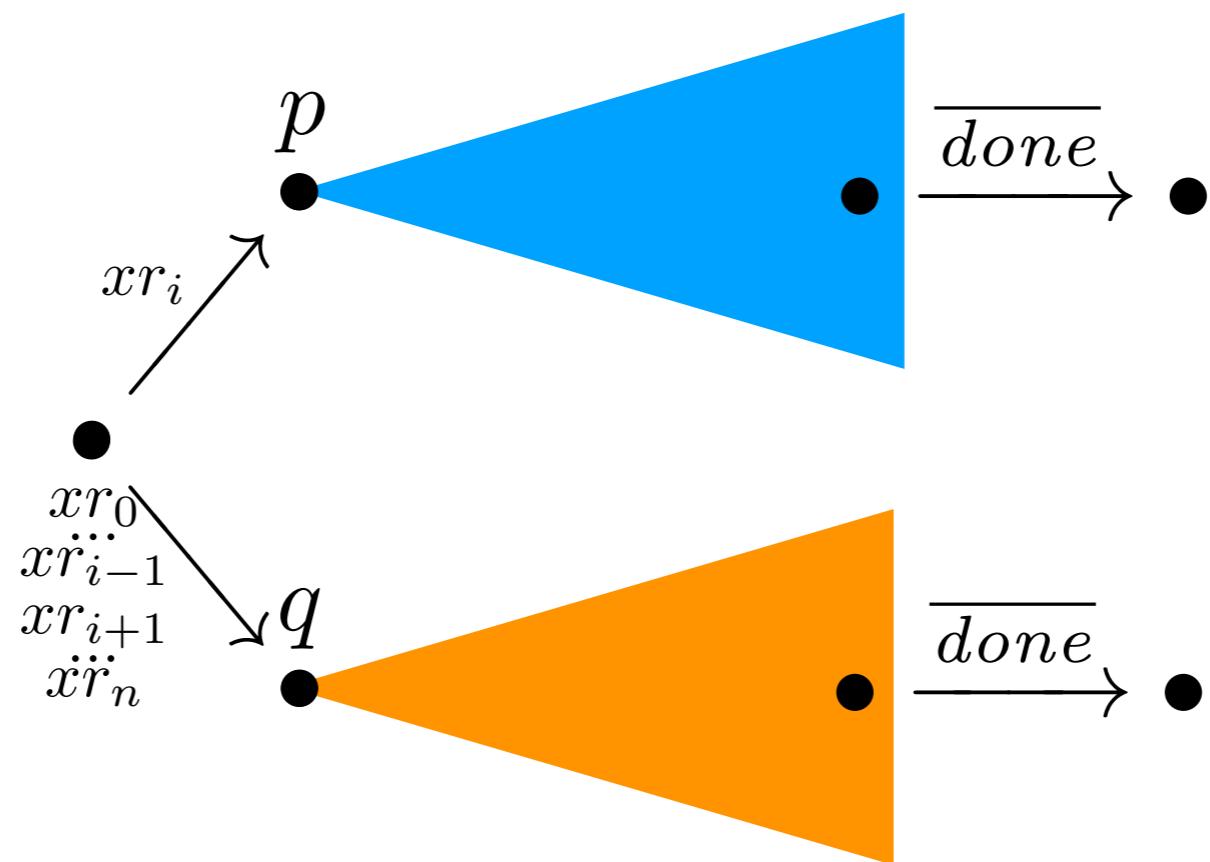

suppose p_1 models c_1

p_2 models c_2

receives the state of the variable
and then chooses accordingly

$$xr_i.p_1 + \sum_{j \neq i} xr_j.p_2$$

Conditional

Iteration

while $x = v_i$ do c

suppose p models c

receives the state of the variable
and then chooses accordingly, possibly recurring

$$\mathbf{rec} \ y. \ xr_i.(p[\phi_d]|d.y) \setminus d + \sum_{j \neq i} xr_j.\text{Done}$$

$$Y \triangleq xr_i.(p[\phi_d]|d.Y) \setminus d + \sum_{j \neq i} xr_j.\text{Done}$$

$$Y \triangleq xr_i.(p \frown Y) + \sum_{j \neq i} xr_j.\text{Done}$$

Concurrency

$$c_1 \mid c_2$$

suppose

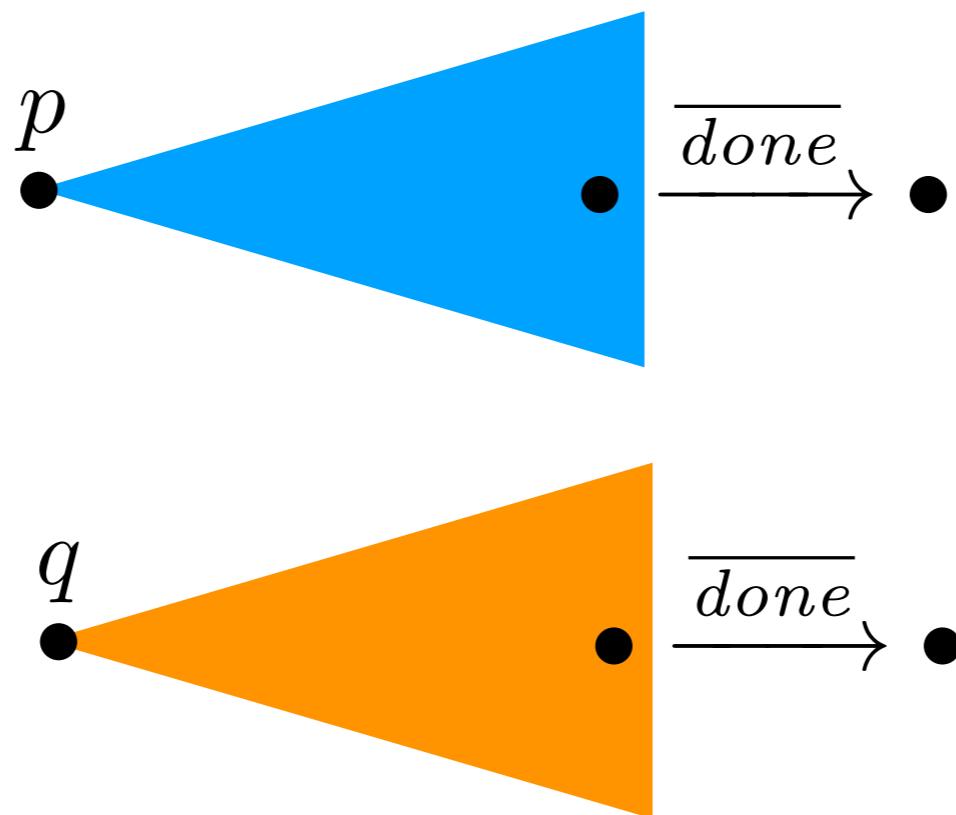

p_1 models c_1

p_2 models c_2

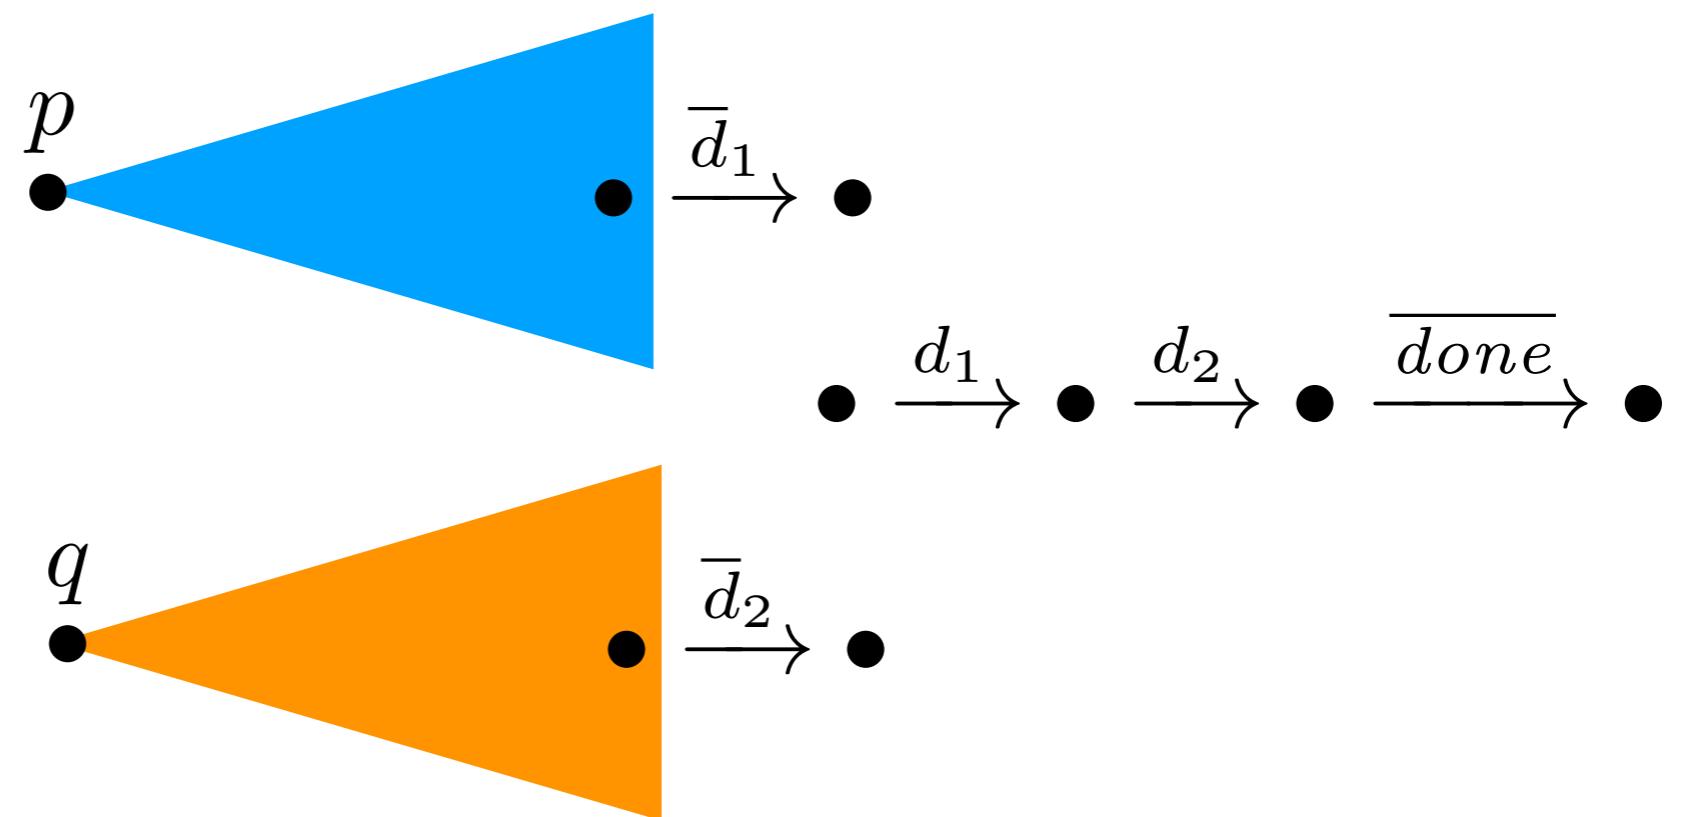

$$p_1 | p_2$$

unfortunate choice: *done* is possibly issued twice

Concurrent termination

Joint termination

Concurrency

$$c_1 \mid c_2$$

suppose

p_1 models c_1

p_2 models c_2

$$(p_1[\phi_{d_1}] \mid p_2[\phi_{d_2}] \mid d_1.d_2.\text{Done}) \backslash d_1 \backslash d_2$$

the order is not important: both must be done to terminate

$$(p_1[\phi_d] \mid p_2[\phi_d] \mid d.d.\text{Done}) \backslash d$$

$$(p_1[\phi_d] \mid p_2[\phi_d] \mid d^2.\text{Done}) \backslash d$$

Finally

all channels for communicating with variables
must be restricted at the top
to guarantee read/write requests are synchronised

$$p \setminus \{xw_1, xr_1, \dots\}$$

several optimisations are possible:
action prefix instead of linking for sequential composition
allows more expressive guards
remove silent transitions
introduce constants for loops
implement expressions
...

Example: optimisation

$$x := 1; y := 2$$

$$\overline{xw}_1.\overline{done} \quad \sim \quad \overline{yw}_2.\overline{done}$$

$$(\ (\overline{xw}_1.\overline{done})[\phi_d] \mid d.\overline{yw}_2.\overline{done})\backslash d$$

$$\overline{xw}_1.\overline{yw}_2.\overline{done}$$

Example: optimisation

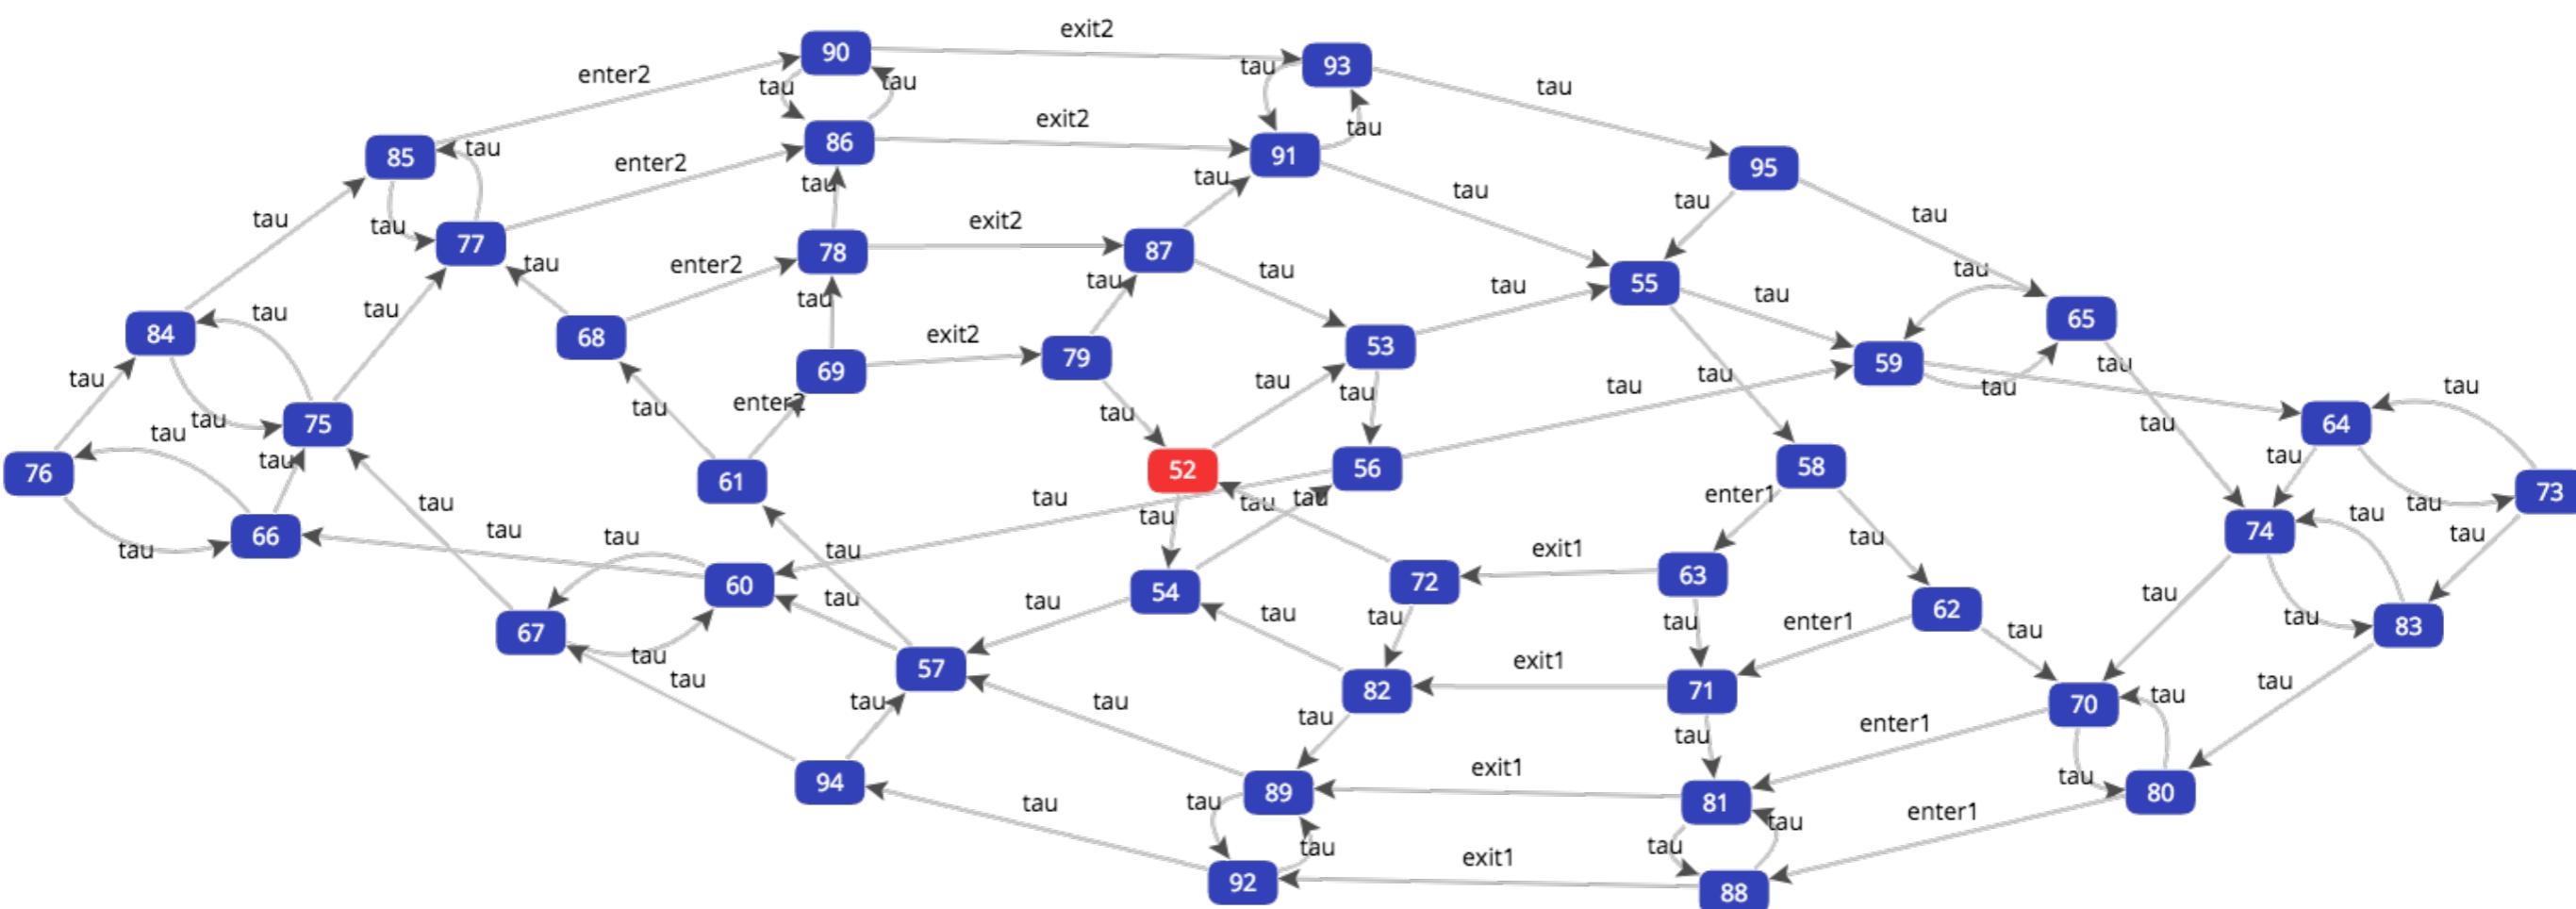

if $b(x)$ **then** c_1 **else** c_2

$$\sum_{b(v_i)} xr_i.p_1 + \sum_{\neg b(v_j)} xr_j.p_2$$

CCS

Playing with CAAL

Concurrency Workbench, Aalborg Edition

http://caal.cs.aau.dk//

CAAL

CAAL is a web-based tool for modeling, visualization and verification of concurrent processes in CCS (and its timed extension)

developed for educational purposes

Edit (recursively defined) processes

Explore their LTS (collapse states up to equivalences)

Verify HML formulas satisfaction (model checking)

Verify equivalences between processes
(generate distinguishing formulas)

play bisimulation **Game**

CAAL

Edit processes

Explore LTS

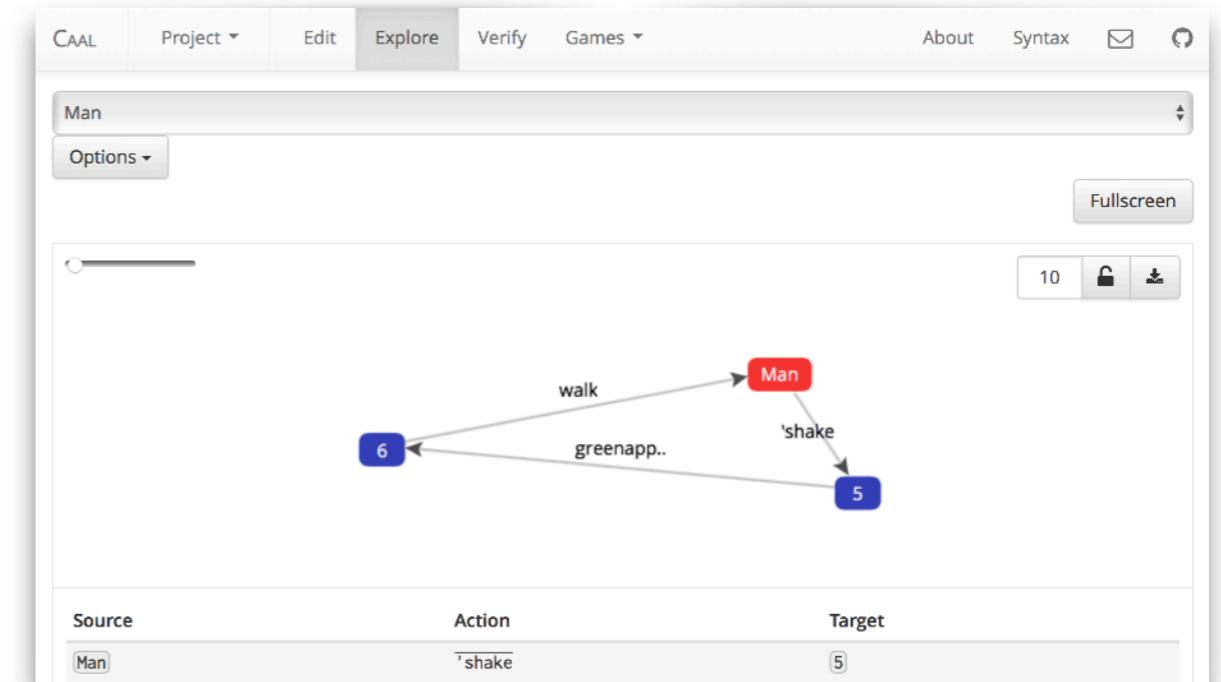

The screenshot shows the CAAL editor interface with the 'Edit' tab selected. The title bar says 'Orchard'. The main area contains the following CAAL code:

```

1 Man = 'shake.(redapple.walk.Man + greenapple.walk.Man);
2
3 AppleTree = shake.('greenapple.AppleTree + 'redapple.AppleTree);
4
5 Orchard = (AppleTree | Man) \ {shake, redapple, greenapple};
6
7 Spec = walk.Spec;

```

Buttons at the top include Parse, CCS, TCCS, and a dropdown set to 20. Below the code is a scroll bar.

Verify HML & Equivalences

The screenshot shows the CAAL editor interface with the 'Verify' tab selected. The title bar says 'Orchard ~ Spec'. The main area displays a table of verification results:

Status	Time	Property	Verify	Edit	Delete	Options
✗	26 ms	Orchard ~ Spec	↻	✎	✖	☰
✓	25 ms	Orchard ≈ <tau>tt	↻	✎	✖	☰
✗	25 ms	Spec ≈ <tau>tt	↻	✎	✖	☰
✓	25 ms	Orchard ≈ Spec	↻	✎	✖	☰

Buttons at the top include Stop and Verify All. Below the table is a scroll bar.

50 prisoners puzzle

50 prisoners kept in separate cells got a chance to be released:
from time to time one of them will be carried in a special room and then back to cell.
(in no particular order, possibly multiple times consecutively, but fairly to avoid infinite wait)

The room is completely empty except for a switch that can turn the light on or off
(the light is not visible from outside).

At any time, if any of them claims rightfully that all the prisoners have already entered the room at least once, then all prisoners will be released
(but if it proves wrong, then the chance ends and they will never be released).

The prisoners have the possibility to discuss in advance some protocol to follow
(not all prisoner must behave in the same way).

Can you find a winning strategy for the prisoners?
Can you formalise it in CCS (for 2 to 4 prisoners)?

- Easy case: it is known that the light in the room is initially off
- Hard case: the initial state of the light in the room is not known.
