

Business Processes Modelling

MPB (6 cfu, 295AA)

Roberto Bruni

<http://www.di.unipi.it/~bruni>

01 - Introduction

2020-21
Hello?
Is anybody
out there?

2021-...
HELLO!

Every

Wednesday:

16:00-18:00

M1

Thursday:

16:00-18:00

M1

Who am I?

<http://www.di.unipi.it/~bruni>

bruni@di.unipi.it

Office hours: by appointment
preferably

Wednesday 14:00-16:00

Who are you?

Some quotes

All models are wrong, but some are useful

- George Box

Subjects are divided in two categories:

1) *too difficult matters, that CANNOT be studied*

2) *easy matters, that DO NOT NEED to be studied*

- back of a t-shirt

The Course

What is a BP?

Any set of steps aimed to reach some outcome

from opening an account

to processing a custom order

What is BPM about?

Course objectives

Key issues in Business Process Management (patterns, architectures, methodologies,...)

Analysis techniques and correctness by construction (soundness, boundedness, liveness, free-choice,...)

Graphical languages & visual notation (BPMN, EPC, ...)

Tool-supported verification (WoPeD, ProM, Woflan, ...)

Structural properties, behavioural properties and problematic issues (dead tasks, deadlocks, ...)

Performance analysis (bottlenecks, simulation, capacity planning,...)

Formal models (automata, Petri nets, workflow nets, ...)

Process mining (discovery, conformance checking, enhancement,...)

Course activities

attend classrooms:
ask questions!
(sleep quietly)

learn theorems:
(drink many coffees)

do some thinking:
solve ALL exercises
(at least try to)

deliver a project:
practice with concepts,
experiment with tools

give the exam:
time for a party!

Main Textbook

Mathias Weske

Business Process Management: Concepts, Languages, Architectures
(3rd ed.) Springer 2019

Modelling

Giving shape to ideas, organizations, processes, collaborations, practices

Modelling

Giving shape to ideas, organizations, processes, collaborations, practices

Modelling

Giving shape to ideas, organizations, processes, collaborations, practices

To analyse them

Modelling

Giving shape to ideas, organizations, processes, collaborations, practices

To analyse them

To communicate them to others

To change them if needed

Quoting Michelangelo

*Every block of stone has
a statue inside it and it is the task
of the sculptor to discover it.*

Michelangelo

Quoting Michelangelo

*Every organization has some processes
running inside it and it is the task of
the designer to discover them*

A taste of BPMN

What

Data and processes

Traditionally, information systems used **information modelling** as a starting point

How

Data and processes

Nowadays, **processes** are of equal importance and need to be supported in a systematic manner

Motivation

- Each product is the outcome of a number of activities performed
- Because of modern communication facilities:
 - traditional product cycles not suitable for today's dynamic market
- Competitive advantages of successful companies:
 - the ability to bring new products to the market rapidly and
 - the ability to adapt an existing product at low cost
- Business processes are the key instrument:
 - to organize these activities
 - to improve the understanding of their relationships
- IT is an essential support for this aim

Workflow wave

WORKFLOW REDESIGN

Geff

In the mid-nineties, workflow management systems aimed to the automation of structured processes

but their application was restricted to only a few application domains

"And this is where our ED workflow redesign team went insane."

Process awareness

BPM moves from
workflow management systems
(intra-organization)

to the broader perspective of
process-aware
information systems
(inter-organizations)

Process awareness

BEFORE BPM

Know end goal

Handled differently every time

AFTER BPM

Know how to handle each occurrence

AFTER BPMS

Benefits of BPM

automate workflow and orchestrate processes,
reduce risk of errors,
provide metrics,
real time status,
enforce deadlines,
validate data,
reduce training costs,
...

What is the BPM maturity of your organization?

1 initial

No structured BPM activities in the area of responsibility of the stakeholder.

2 awareness

Awareness of BPM exists in the organization.

(Planning) activities have started for the definition of the subject.

3 defined

BPM is defined.

Implementation is yet missing or ongoing.

4 managed

BPM is implemented. (People assigned. Communication to relevant people done. Training done, etc.)

5 excellence

BPM is implemented enterprise-wide. A continuous review & improvement process is implemented to exchange lessons-learned & address required changes proactively.

© 2008 IDS SCHEER

Why BPM?

Highly relevant for
practitioners

Offers many challenges for
software developers and
computer scientists

BPM angles

Analysis: simulation,
verification, process mining, ...

Influences: business aspects,
social aspects, training, education, ...

Technologies: interoperability,
standardization efforts,
service orientation, ...

Essential concepts

Different educational
backgrounds and interests
are in place

This course is not about a
particular XML syntax (e.g., BPMN)
or tool (e.g. ProM)

It is about using some process
languages to describe, single out,
relate, compare essential concepts

Which target?

Formal methods people

- investigate properties
- detect and correct deficiencies
- abstract from "real world"

Software develop people

- provide robust and scalable sw
- integration of existing sw
- look at new technology trends

Business admin people

- increase customer satisfaction
- reducing costs
- establishing new products

Aim

Robust and correct realization of

business processes in software that

increases customer satisfaction and

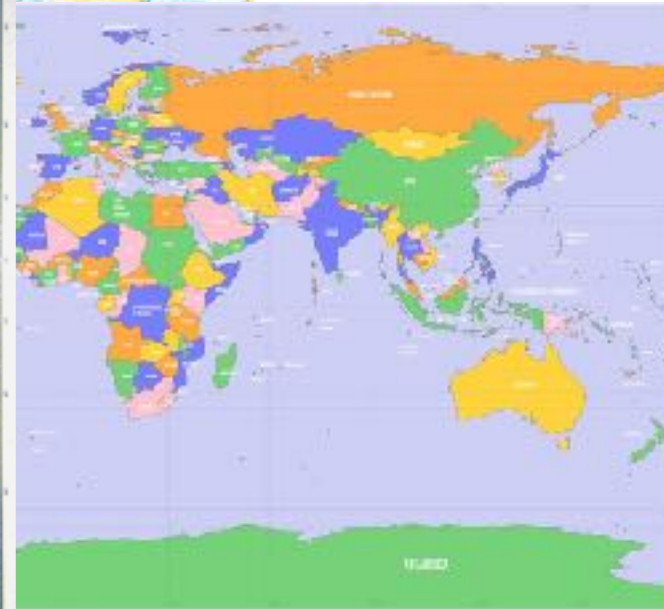

ultimately contributes to the competitive
advantage of an enterprise

Abstraction

- Business admin people
 -  – IT as a subordinate aspect (for expert technicians)
 - **This course: too much math!**
- Software develop people
 -  – Current technology trend as main concern
 - **This course: too abstract!**
- Formal methods people
 -  – Underestimate business goals and regulations
 - **This course: too much handwaving!**

Abstraction as the key to achieve some common understanding, to build a bridge between views...

Levels of abstractions

One object,
many views

Different views are common

Different purposes
Different abstractions
Different models

Same purpose
Different abstractions
Different models

Everybody wants to be the Italian soccer team coach

What about the adversaries?

Can we find out their plan?

Knowing it would
be quite helpful

Any idea how to?

(abstractions can be designed but can also be derived)

A taste of Process Mining

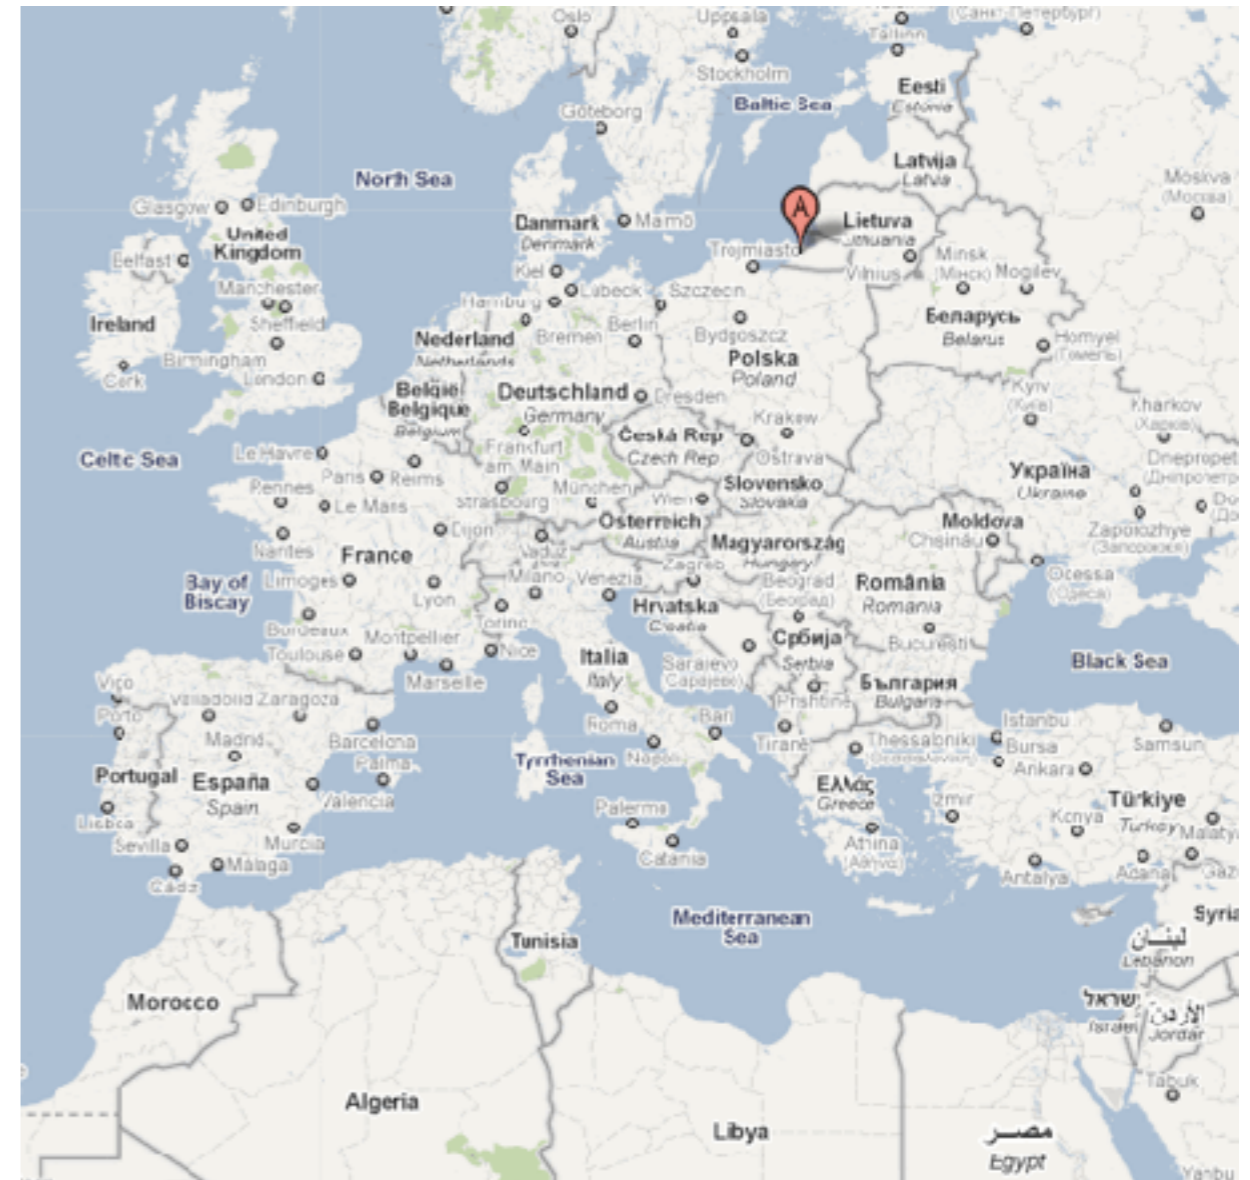

Digression

Digression...

On the shores of the Baltic Sea wedged between Lithuania and Poland is a region of Russia known as the [Kaliningrad Oblast](#).

The city of [Kaliningrad](#) is a bleak industrial port built hastily after World War II, when the city had been obliterated first by Allied bombers and later by the invading Russian forces.

Little remains of the beautiful Prussian city of [Königsberg](#), as it was formerly known.

Digression...

This is sad not only for lovers of architecture, but also for nostalgic mathematicians:

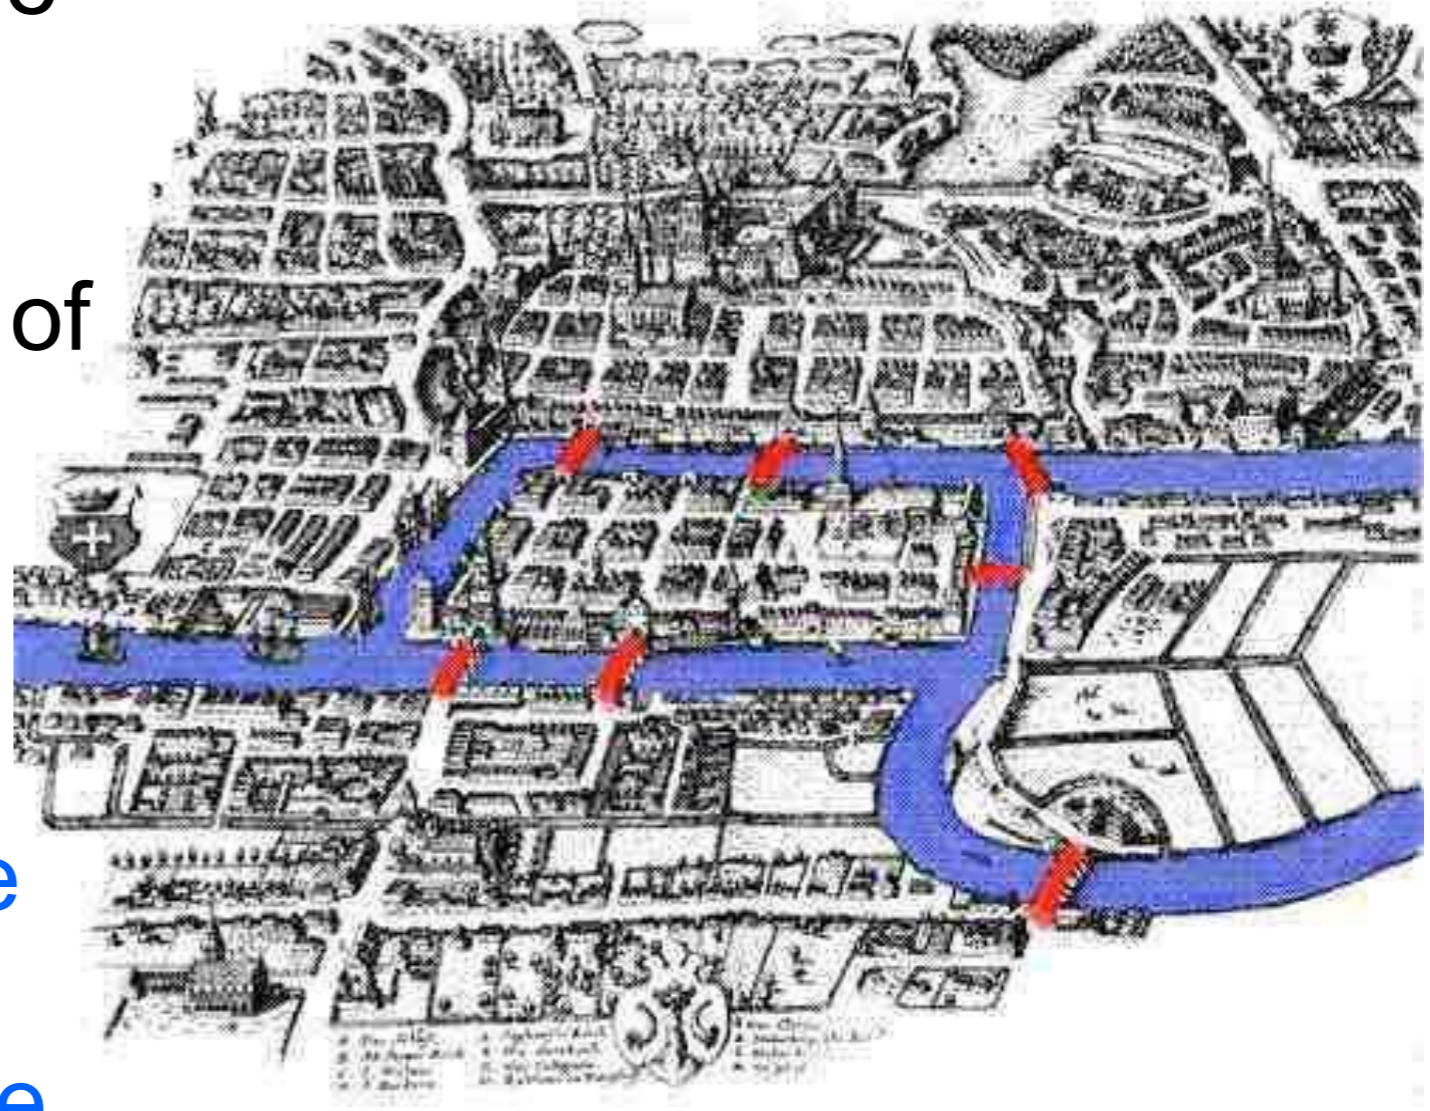

it was thanks to the layout of 18th century Königsberg that **Leonhard Euler** answered a puzzle which eventually contributed to the birth of two new areas of maths known as **topology** and **graph theory**.

Digression...

Königsberg was built on the bank of the river Pregel.
Seven bridges connected two islands and the banks of the river (see map).

A popular pastime of the residents was to try to **cross all the bridges in one complete circuit** (without crossing any of the bridges more than once).

Digression...

A seemingly simple task was more than tricky...

Nobody had been able to find a solution to the puzzle when Euler first heard of it and, intrigued by this, he set about **proving** that **no solution was possible!**

Digression...

In 1736, Euler analysed the problem by converting the map into a more abstract diagram... and then into a **graph** (a formal model):

areas of land separated by the river were turned into points, which he labelled with capital letters.

Modern graph theorists call these **vertices** or **nodes**.

The bridges became **edges** between nodes.

Digression...

Modeling activities require several steps of abstraction that **must preserve the set of solutions**: in other words the abstractions must preserve the topology of the problem.

Original problem: *seven bridges of Königsberg*

Graph problem: *redrawing this picture without retracing any line and without picking your pencil up off the paper*

Generalized problem: *given a **connected** graph, find a **circuit** that visits every edge precisely once, **if it exists***

Digression...

A non-connected graph

Digression...

Informal reasoning:

All the vertices in the picture are connected to an **odd** number of edges

In a circuit every time you enter a node you must be able to leave it: thus, every vertex must be connected to an **even** number of edges!

This suffices to establish that no solution can be found!

Digression...

Take one of these vertices, say A, and start trying to trace the figure out without picking up your pencil: then two edges are left from/to A.

Next time you arrive in A, one edge will be left, and when you will leave A, no edge to re-enter it will be left!

Analogously for B, C, D: No circuit is possible!

Digression...

Formal reasoning:

Definition: A **path** is a (finite) sequence of contiguous edges. It is a **circuit** if it ends in the same vertex where it starts.

Definition: An **Eulerian path** is a path that passes through every edge of the graph once and only once.

Definition: The number of edges attached to v is called **degree** of v . A vertex is called **odd** if it has an odd degree, **even** otherwise.

Theorem: A (connected) graph G contains an Eulerian circuit **if and only if** each vertex is even.

Digression...

Theorem: A (connected) graph G contains an Eulerian circuit if and only if each vertex is even.

Digression...

Proof of necessity:

(existence of Eulerian circuit implies any vertex is even)

Suppose G contains an Eulerian circuit C .

Then, for any choice of vertex v , C contains all the edges that are adjacent to v .

*Furthermore, as we traverse along C , we must enter and leave v the same number of times, and it follows that v must be even. **qed***

While this proof of necessity was given by Euler, the converse was not stated in his paper.

It is not until 1873 (137 years later) when a young German mathematician, [Carl Hierholzer](#) published the proof of sufficiency.

Digression...

Proof of sufficiency: (by [induction](#) on the numbers of edges, ctd)

Base case: the smallest possible number of edges is 3 (i.e. a triangle) and the graph trivially contains an Eulerian circuit.

Digression...

Proof of sufficiency: (by **induction** on the numbers of edges, ctd)

Inductive case:

Inductive hypothesis: Let us assume that any connected graph H that contains k or less than k edges and such that every vertex of H is even, contains an Eulerian circuit.

Now, let G be a graph with $k + 1$ edges, and such that every vertex is even. We want to prove G has an Eulerian circuit

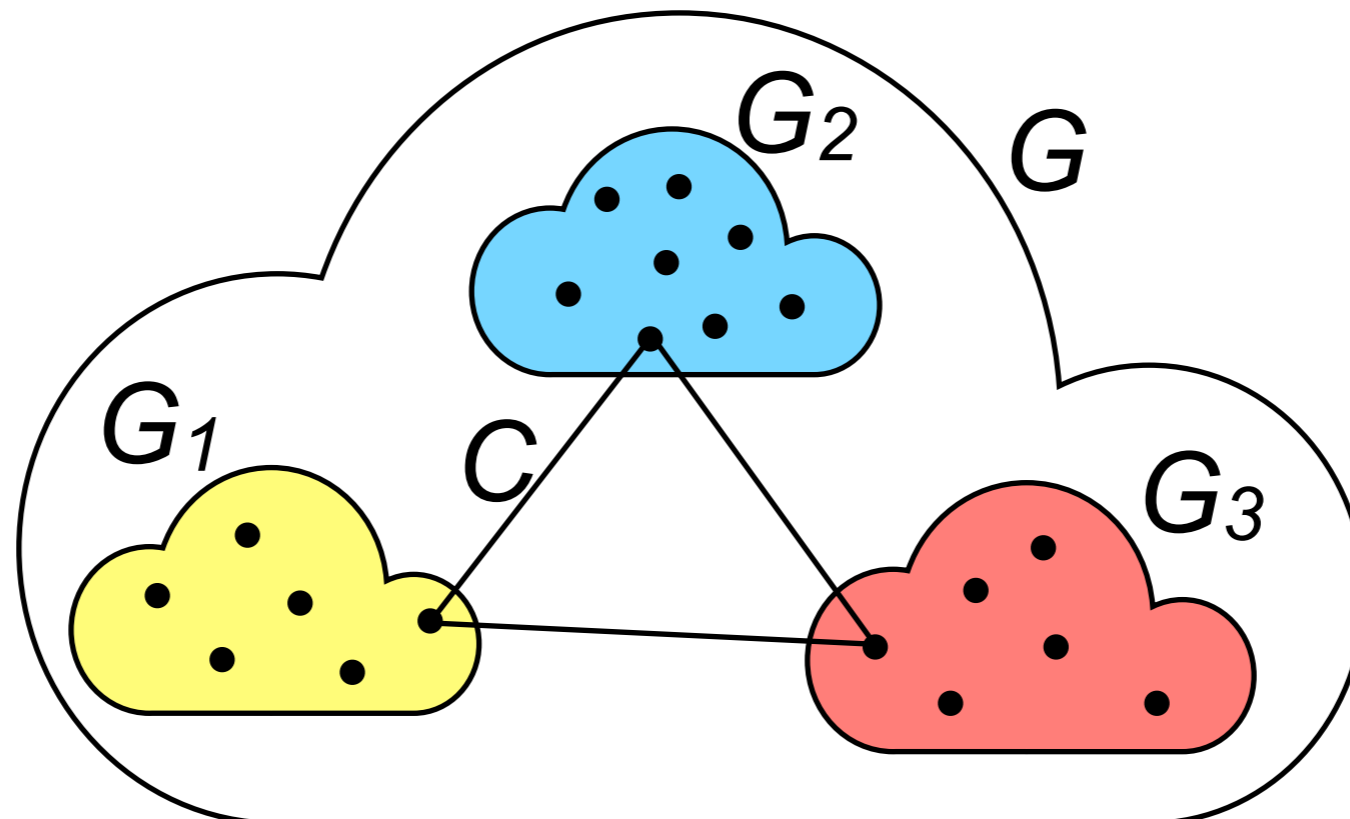

Since there is no odd vertex, G cannot be a tree (no leaves). Thus, G must contain at least one cycle C .

...

Digression...

Proof of sufficiency: (by [induction](#) on the numbers of edges, ctd)
... Now, remove the edges of C from G , and consider the remaining graph G' .

Since removing C from G may disconnect the graph, G' is a collection of connected components, namely G_1, G_2, \dots , etc.

...

Digression...

Proof of sufficiency: (by [induction](#) on the numbers of edges, ctd)
... Now, remove the edges of C from G , and consider the remaining graph G' .

Since removing C from G may disconnect the graph, G' is a collection of connected components, namely G_1, G_2, \dots , etc.

...

Digression...

Proof of sufficiency: (by **induction** on the numbers of edges, ctd)
... Furthermore, when the edges in C are removed from G , each vertex loses an even number of adjacent edges. Thus, the parity of each vertex is unchanged in G' .

It follows that, for each connected component of G' , every vertex is even (and G' has less than k edges).

Therefore, by the induction hypothesis, each of G_1, G_2, \dots has its own Eulerian circuit, namely C_1, C_2, \dots , etc.

...

Digression...

Proof of sufficiency: (by **induction** on the numbers of edges, ctd)
... We can now build an Eulerian circuit for the whole graph G .

Pick an arbitrary vertex v from C .

Traverse the edges along C until we reach a vertex v_i that belongs to one of the connected components G_i .

Then, traverse G_i along its Eulerian circuit C_i until we traverse all the edges of C_i .

We are now back at v_i , and so we can continue on along C .

*In the end, we shall return back to the first starting vertex v of C , after visiting every edge exactly once. **qed***

Digression...

The theorem, as such, is only an existential statement.

If the necessary and sufficient condition is satisfied, we'd like to find an Eulerian circuit.

The sufficiency proof gives us an algorithm to build Eulerian circuits: **recursively find a cycle, and then remove the edges of the cycle.**

Digression...

The theorem, as such, is only an existential statement.

If the necessary and sufficient condition is satisfied, we wish to find an Eulerian circuit.

The proof naturally gives an algorithm to construct Eulerian circuits: **recursively find a cycle, and then remove the edges of the cycle.**

Digression...

Theorem: A graph contains an **Eulerian path** if and only if there are 0 or 2 odd vertices.

Proof.

Suppose a graph G contains an Eulerian path P .

Then, for every vertex v , P must enter and leave v the same number of times, except when it is either the starting vertex or the final vertex of P .

When the starting and final vertices are distinct, there are precisely 2 odd vertices.

When these two vertices coincide, there is no odd vertex.

Conversely, suppose G contains 2 odd vertices u and v .

(The case where G has no odd degree vertex is shown in the previous Theorem.)

Then, temporarily add a dummy edge (u, v) to G .

Now the modified graph contains no odd vertex.

By the previous Theorem, this graph contains an Eulerian circuit C that includes (u, v) .

Remove (u, v) from C , and now we have an Eulerian path where u and v serve as initial and final vertices.

Digression...

In the late 19th century an eighth bridge was built (see map).
Was Königsberg Eulerised?

Exercise: prove that an Eulerian path can be found (but not a circuit)

Sadly, in 1944 air raids obliterated most of the bridges. However, five bridges crossing were rebuilt (see map).
Was Kaliningrad Eulerised?

Exercise: prove that an Eulerian path can be found (but not a circuit)

Digression...

Exercises: find Eulerian paths/circuits in the graphs above or prove that they cannot exist.

Recap

Lessons learned

- Start with a concrete instance of the problem
- Abstraction: modeling and generalization, property preserving
- Visual notation: informal, intuitive
- Mathematical notation: rigorous, precise
- Theorems: alternative ways to find answers
- Proofs: construct solutions from formal reasoning
- Implementation: solve any concrete instance of the problem

Yet to learn

- Formal models used in prescriptive manner
- Correctness by design
- Separation of concerns
- Model discovery

Avoid bad designs!
