06 - BP Lifecycle
Object

Overview the business process lifecycle

Sect.1.2 of Business Process Management: Concepts, Languages, Architectures
A lifecycle model is a conceptual description of the steps that are involved in building a product.

The steps in which the model is broken are called phases (logically consistent, easier to understand).

The number of phases can vary from model to model (typically ranging from four to eighth).
BP lifecycle

Five phases with logical dependencies, organized along a cyclic structure
BP lifecycle

The logical dependencies between different phases do not imply a strict temporal ordering of their execution.

Incremental and evolutionary approaches involving concurrent activities in multiple phases are frequently used.
BP lifecycle

Similar to the **PDCA** scheme (you may have heard of):
a management method for the control and continuous improvement of products
Different from the classical **waterfall model**: a sequential sw design process seen as flowing downwards (like a waterfall) through various phases.
Better structured than **extreme programming** methodology: intended to improve productivity and responsiveness to changing requirements, advocates frequent releases, adding features when needed and a flat management structure.
Business process lifecycle

Design & Analysis

Design:
Business Process Identification and Modeling

Analysis:
Validation
Simulation
Verification
Context

Matrix organizational structure
Identification

Require surveys on:
the business processes
their organizational environment
their technical environment

Based on these surveys, business processes are:
identified
reviewed
validated
represented (by business process models)
Modeling

Core technical sub-phase:

from informal descriptions
to a particular business process modeling notation

Explicit business process models expressed in a graphical notation facilitate communication about these processes so that different stakeholders can:

communicate efficiently
refine them
improve them
Look, see, imagine, show
Validation

The initial design must be validated by checking that all valid process instances are reflected by the business process model.

Useful instrument: a workshop where the persons involved can discuss the business process model.
Validation

- desired instances
- undesired instances

proposed process
Validation

- desired instances
- undesired instances

proposed process

desired process
Simulation

Simulation techniques can support validation

Stakeholders can walk through the process in a step-by-step manner

Check whether processes expose all desired behaviour

Estimate performance measures (e.g., time, cost, …)

Discover undesired execution sequences to show deficits in the process model
Verification

The business process model must be analyzed and improved to make sure:

all tasks can be used in some instance

it can always come to an end (e.g., absence of deadlock)

it actually includes all desired instances
it does not allow any undesired instance

Error-prone activities, to be repeated several times, for which automatic tools are necessary
Business process lifecycle

Configuration:
- System Selection
- Implementation
- Test and Deployment
Configuration phase

From (verified) business process models to implementation as

a set of policies, guidelines and procedures (to be followed by employees)

a dedicated software system (over a chosen implementation platform: a business process management system)
Enhanced models

Software systems usually require additional technical information

The model must be decorated with such data, to be exploited for configuring the system

Examples: interactions of the employees with the system, integration of existing systems, wrapping of legacy software
Testing

When the system is configured, it must be tested before deployment

Usual testing techniques from sw engineering
Integration tests
Performance tests

Other possible activities:
training of personnel,
migration of application data
Business process lifecycle

Enactment:
- Operation
- Monitoring
- Maintenance

Enactment
Enactment phase

When the system is deployed, business process instances can be enacted.

Typically, each process instance is initiated after an event occurs (e.g., the receipt of an order).

The system must control and monitor the execution of all instances according to the model to guarantee a correct process orchestration (e.g., respecting dependencies).
Activities can be performed by employees **manually** or by the help of information systems.

Other activities can be enacted **automatically** by information systems.

Some activities can **trigger** or **inhibit** other activities.
Monitoring

At each moment in time, the current status of any instance must be known (and logged) by the system as accurately as possible.

Both for process instances and activity instances.

Helpful visualization techniques can be provided by business process management systems (e.g., coloured activities).

Such information is highly valuable for customers (e.g., tracking of orders).
Business process lifecycle

Evaluation:
- Process Mining
- Business Activity Monitoring

Evaluation
Evaluation phase

Execution **logs** are of fundamental importance

The information collected during instances enactment can be used to evaluate and improve business process models

Business **activity monitoring** and **process mining** techniques aim at identifying the quality of the model and the adequacy of the environment
BA monitoring

Log files typically include information such as the start / end timestamps of activity instances

Activity monitoring serve to identify that certain activities take too long or need more resources

The same information can be also exploited in the simulation sub-phase of the design and analysis phase
Mining

Process mining has recently turned into an active field of research

Thanks to mining techniques, execution logs can be used for the automatic generation of business process models in the design and analysis phase

They can also be used to assess and compare different models to see which fits best the enacted instances
Business process lifecycle

Administration and Stakeholders
Administration phase

Business process management involves numerous artifacts at different levels of abstraction.

Such artifacts need to be organized and managed (storage, retrieval, disposal).

A well-structured repository is needed, with powerful query mechanisms.
Stakeholders

Several types of stakeholders co-exist in the process domain

They have different kind of educational background, knowledge, expertise, experience

Roughly, they can be classified into a few roles

CPO  BE  PD  PP  KW  PR  SA  Dev
Chief process officer

Top level management
(CPO reports directly to CEO / board of directors)

- Responsible for defining **rules, policies and guidelines** and establishing control mechanisms
- Responsible for standardizing and harmonizing business processes in the enterprise
- Responsible of business process evolution in the presence of changing market requirements
Business engineer

Business domain expert

Responsible for defining strategic goals of the company and organizational business processes

Often equipped with non-technical educational background (mostly economics)

It is preferred to communicate with these stakeholders by means of simple-to-use process modeling notation
Process designer

Responsible for **modeling business processes** by communicating with business domain experts and other stakeholders

Must be equipped with good analytical capabilities and **excellent communication skills**
Process participants

Conduct the actual **operational work**
during the enactment of processes

They are knowledgeable about the activities conducted,
fundamental information for the modeling phase

Their information must be assembled by the designer to compose an overall picture in the process model
Knowledge worker

Process participants who use software systems to perform activities in a business process, often autonomously
Process responsible

An individual who is held responsible for the correct and efficient execution of all instances of a business process model

Responsible for detecting inefficiencies and improving the process model

Close collaboration with process participants and the process designer is needed
System architect

Responsible for developing and configuring business process management systems on the information system infrastructure at hand.
Developers

Information technology professionals

Responsible for creating the **software artifacts** required to implement business processes

Implementation of interfaces is a relevant part of the work done by developers
