

LABORATORY OF DATA SCIENCE

Python & Spyder- recap

Python

2

Python is a

- ❏ High-level
- ❏ Interpreted (Interpreters for many OS)
- ❏ Dynamically Typed
 - Verification of the type safety of a program at runtime
- ❏ Object oriented
- ❏ Cross-Platform
- ❏ Multi-purpose (WEB, GUI, Scripting)

computer programming language

<https://www.python.org/>

Version release dates [\[edit\]](#)

Release dates for the major and minor versions:^{[31][32]}

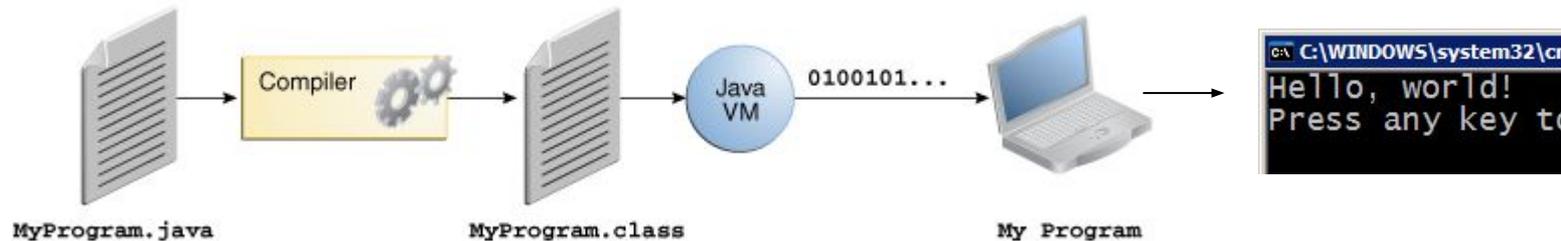

- Implementation started - December, 1989
- Internal releases at [Centrum Wiskunde & Informatica](#) - 1990
- Python 0.9.0 - February 20, 1991
 - Python 0.9.1 - February, 1991
 - Python 0.9.2 - Autumn, 1991
 - Python 0.9.4 - December 24, 1991
 - Python 0.9.5 - January 2, 1992
 - Python 0.9.6 - April 6, 1992
 - Python 0.9.8 - January 9, 1993
 - Python 0.9.9 - July 29, 1993
- Python 1.0 - January 1994
 - Python 1.2 - April 10, 1995
 - Python 1.3 - October 12, 1995
 - Python 1.4 - October 25, 1996
 - Python 1.5 - December 31, 1997
 - Python 1.6 - September 5, 2000
- Python 2.0 - October 16, 2000
 - Python 2.1 - April 15, 2001
 - Python 2.2 - December 21, 2001
 - Python 2.3 - July 29, 2003
 - Python 2.4 - November 30, 2004
 - Python 2.5 - September 19, 2006
 - Python 2.6 - October 1, 2008
 - Python 2.7 - July 4, 2010
- Python 3.0 - December 3, 2008
 - Python 3.1 - June 27, 2009
 - Python 3.2 - February 20, 2011
 - Python 3.3 - September 29, 2012
 - Python 3.4 - March 16, 2014
 - Python 3.5 - September 13, 2015
 - Python 3.6 - December 23, 2016
 - Python 3.7 - June 27, 2018

Compiling and interpreting

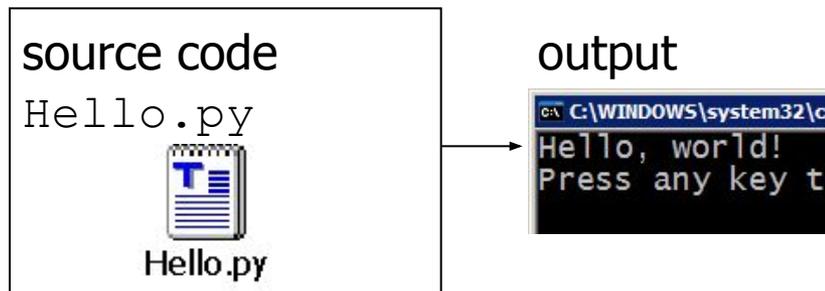

3

- Many languages require you to *compile* (translate) your program into a form that the machine

understands

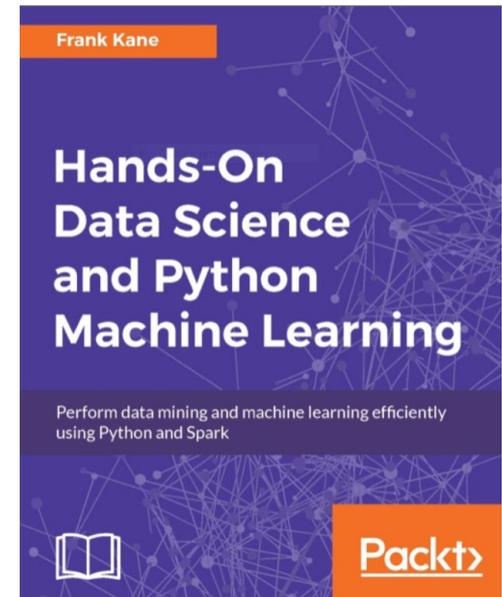

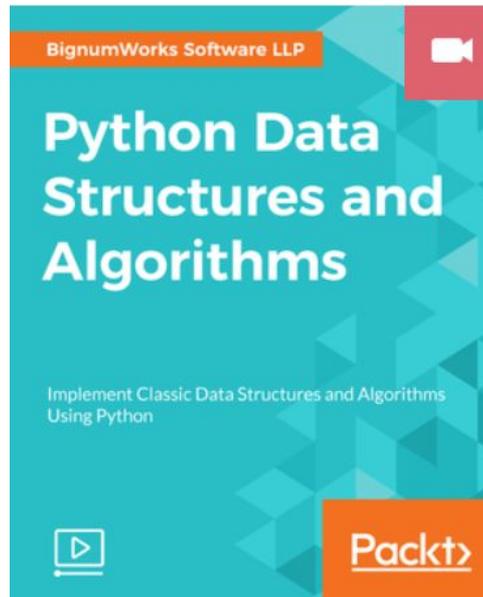

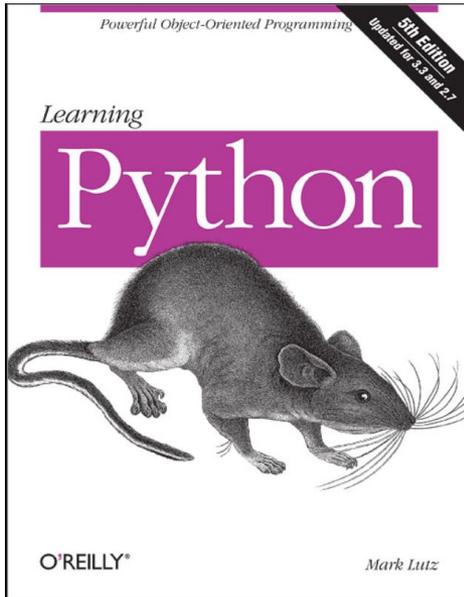

interpret

Python language: books

4

The Coder's Apprentice
Learning Programming with Python 3

Pieter Spronck

<http://www.spronck.net/pythonbook/>

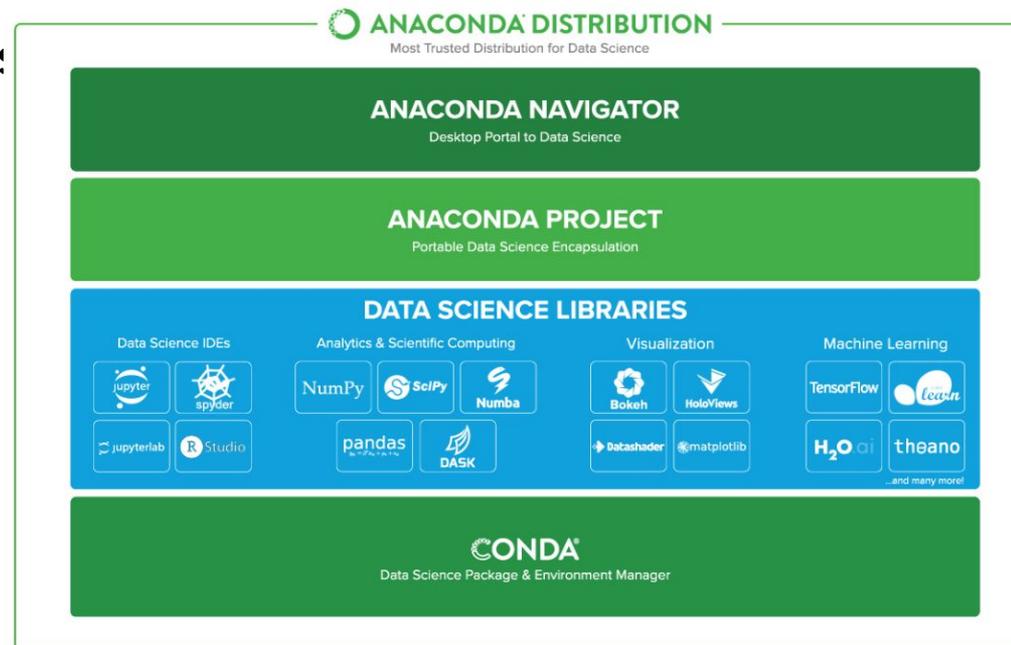

Lab of Data Science

Anaconda - www.anaconda.com

5

- ❑ Manage your DS packages, dependencies, and environments
- ❑ Develop DS projects using Jupyter, JupyterLab, Spyder

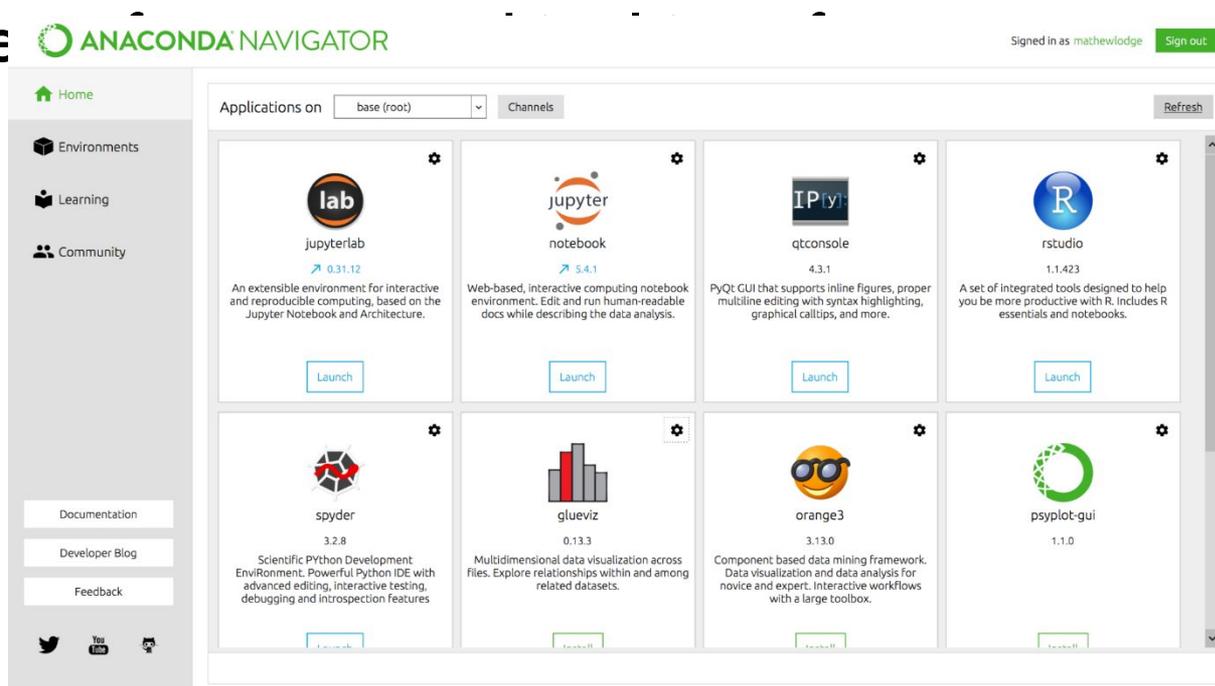

- ❑ Automatically manages all packages, including cross-language dependencies
- ❑ Works across all platforms: Linux, macOS, Windows
- ❑ Create virtual environments

Anaconda Navigator

6

- ❑ Desktop Portal to Data Science
- ❑ Install and launch applications and editors including Jupyter, RStudio, Visual Studio Code, and Spyder
- ❑ Manage your local environments and data science projects

Spyder

7

Spyder is the Scientific Python Development EnviRonment

- advanced editing
- interactive testing
- Debugging

Spyder websites:

- Downloads, bug reports and feature requests: <https://github.com/spyder-ide/spyder>
- Discussions: <http://groups.google.com/group/spyderlib>

8

Python Recap

Indentation

9

```
/* Bogus C code */  
if (foo) {  
    if (bar) {  
        baz(foo, bar);  
    }  
else {  
    qux();  
}}
```

```
# Python code  
if foo:  
    if bar:  
        baz(foo, bar)  
else:  
    qux()
```

Strings

10

```
#This is a string  
name = "Anna Monreale (that\"s me)"
```

```
#This is also a string  
city = 'Pisa'
```

```
#This is a multi-line string  
office = """My office is at the department  
of Computer Science, University of Pisa"""
```

```
#This is also a multi-line string  
other = '''My office hours is on Tuesday in the  
afternoon, however it is always better to take  
an appointment'''
```

String manipulation

11

```
animals = "Cats " + "Dogs "  
animals += "Rabbits"  
# Cats Dogs Rabbits  
  
fruit = ', '.join(['Apple', 'Banana', 'Orange'])  
# Apple, Banana, Orange  
  
date = '%s %d %d' % ('Sept', 11, 2010)  
# Sept 11 2010
```

Numbers

12

```
# Integers Numbers
year = 2010
year = int("2010")

# Floating Point Numbers
pi = 3.14159265
pi = float("3.14159265")

# Fixed Point Numbers
from decimal import Decimal
price = Decimal("0.02")
```

Arithmetic

13

```
a = 10          # 10
a += 1         # 11
a -= 1         # 10

b = a + 1      # 11
c = a - 1      # 9

d = a * 2      # 20
e = a / 2      # 5
f = a % 3      # 1
g = a ** 2     # 100
```

Lists

14

```
# Lists can be heterogeneous
favorites = []

# Appending
favorites.append(42)

# Extending
favorites.extend(["Python", True])

# Equivalent to
favorites = [42, "Python", True]
```

Lists

15

```
numbers = [1, 2, 3, 4, 5]
```

```
len(numbers)
```

```
# 5
```

```
numbers[0]
```

```
# 1
```

```
numbers[0:2]
```

```
# [1, 2]
```

```
numbers[2:]
```

```
# [3, 4, 5]
```

Dictionary

16

```
person = {}

# Set by key / Get by key
person['name'] = 'Nowell Strite'

# Update
person.update({
    'favorites': [42, 'food'],
    'gender': 'male',
})

# Any immutable object can be a dictionary key
person[42] = 'favorite number'
person[(44.47, -73.21)] = 'coordinates'
```

Dictionary

17

```
person = {'name': 'Nowell', 'gender': 'Male'}

person['name']
person.get('name', 'Anonymous')
# 'Nowell Strite'

person.keys()
# ['name', 'gender']

person.values()
# ['Nowell', 'Male']

person.items()
# [['name', 'Nowell'], ['gender', 'Male']]
```

If-then-else

18

```
grade = 82
if grade >= 90:
    if grade == 100:
        print 'A+'
    else:
        print "A"
elif grade >= 80:
    print "B"
elif grade >= 70:
    print "C"
else:
    print "F"

# B
```

For Loop

19

```
for x in range(10): #0-9
    print(x)
```

```
fruits = ['Apple', 'Orange']

for fruit in fruits:
    print(fruit)
```

```
states = {
    'VT': 'Vermont',
    'ME': 'Maine',
}

for key, value in states.items():
    print('%s: %s' % (key, value))
```

Function Definition

20

```
def my_function():  
    """Function Documentation"""  
    print("Hello World")
```

```
# Positional  
def add(x, y):  
    return x + y  
  
# Keyword  
def shout(phrase='Yipee!'):  
    print(phrase)  
  
# Positional + Keyword  
def echo(text, prefix=''):  
    print('%s%s' % (prefix, text))
```

Import packages

21

```
# Renaming imports
from datetime import date
from my_module import date as my_date

# This is usually considered a big No-No
from datetime import *
```

Kinds of Imports

22

```
└─ project
  └─ package1
    ├── module1.py
    └─ module2.py
  └─ package2
    ├── __init__.py
    ├── module3.py
    ├── module4.py
    └─ subpackage1
      └─ module5.py
```

```
from package1 import module1
from package1.module2 import function1
from package2 import class1
from package2.subpackage1.module5 import function2
```

Absolute

```
# package1/module1.py
from .module2 import function1
```

Relative

```
# package2/module3.py
from . import class1
from .subpackage1.module5 import function2
```

Error Handling

23

```
import datetime
import random

day = random.choice(['Eleventh', 11])
try:
    date = 'September ' + day
except TypeError:
    date = datetime.date(2010, 9, day)
else:
    date += ' 2010'
finally:
    print(date)
```

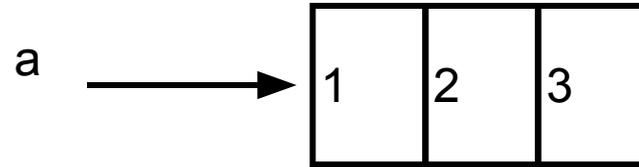

Reference Semantics

- ❑ Assignment manipulates references
 - $x = y$ **does not make a copy** of y
 - $x = y$ makes x **reference** the object y references
- ❑ Very useful; but beware!
- ❑ Example:

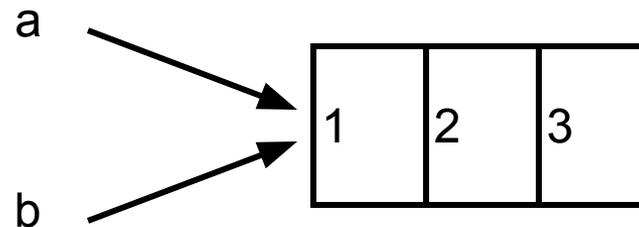

```
>>> a = [1, 2, 3]
>>> b = a
>>> a.append(4)
>>> print b
[1, 2, 3, 4]
```

Changing a Shared List

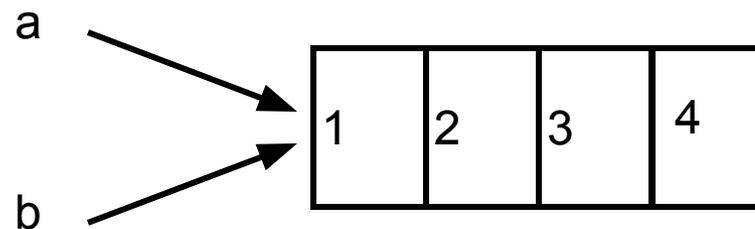

`a = [1, 2, 3]`

`b = a`

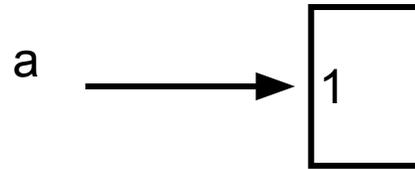

`a.append(4)`

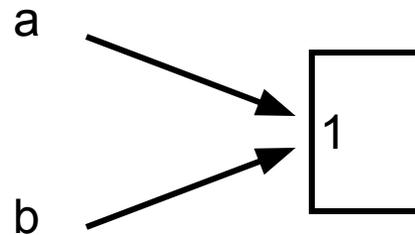

Changing an Integer

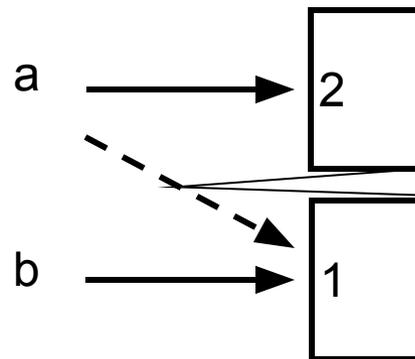

a = 1

b = a

a = a+1

new int object created
by add operator (1+1)

old reference deleted
by assignment (a=...)

Exercise: maximal subsequence

27

- Given an array of integers, e.g.
 - ▣ $a = [-2, 1, -3, 4, -1, 2, 1, -5, 4];$
- and called
 - ▣ $S(h, k) = \sum_{i=h}^k a[i]$
- the sum of subsequence from h to k , find the maximal $S(h, k)$
 - ▣ $\max S(h, k)$
- For the array above $\max S(h, k) = S(3, 6) = 4 - 1 + 2 + 1 = 6$

- Variants: array of integers
 - ▣ passed on the command line
 - ▣ read from a text file (one int per line)

Exercise: lists and dictionaries

28

- Given the list: `l = [12, 3, -4, 6, -5, 9]`
- Given the dictionary:
 - `d = {'apple':3, 'orange':4, 'tomato':-5, 'meat':6, 'potato':15, 'strawberry':9}`
- If a value in the dictionary is found in the list, add the corresponding key to a string named 'to-buy' and print it at the end.
- If a value in the dictionary is not found in the list, chose another value in the list, that is not present in the dictionary, and assign it to the corresponding key. Print the updated dictionary at the end.

Exercise: lists

- Given 2 lists:

$a = [12, 3, 4, 6, 5, 9]$

$b = [10, 3, 2, 6, 3, 7]$

Compute the Pearson's correlation.
