DATA VISUALIZATION AND VISUAL ANALYTICS

TAXONOMY OF VISUAL VARIABLES

Cleveland McGill [1984]

Figure 4. Graphs from position-length experiment.

Figure 3. Graphs from position-angle experiment.

Cleveland & McGill: graphical encodings

- Angle
- Area
- Color Hue
- Color Saturation
- Density
- Length
- Position on a common scale
- Position on non aligned scale
- Slope
- Volume

Angle decoding

- It is difficult to compare angles
 - Underestimation of acute angles
 - Overestimation of obtuse angles
 - Easier if bisectors are aligned
- Area estimation helps

Angle decoding

- It is difficult to compare angles
 - Underestimation of acute angles
 - Overestimation of obtuse angles
 - Easier if bisectors are aligned

Slopes Decoding

- Same difficulties as angles
- Easier task since one branch is aligned with x-axis

Area Decoding

- Area is not well decoded
 - Different regular shapes
 - Irregular shapes
 - Context influences (thin area within compact thick area)

Length Decoding

- Straight forward to encode numerical values
- Difficulties with relative lengths

Position on a common scale

- Widely used in statistical charts

Position on non-aligned scale

- Not as bad as common scale
- Still acceptable

Designing Effective Visualizations

- If possible, use graphical encoding that are easily decoded
- Graphical Attributes ordered (Cleveland & McGill):
 - Position along a common scale
 - Position on non aligned scales
 - Length
 - Angle and Slope
 - Area
 - Volume, density, color saturation
 - Color Hue

PERCEPTION LAWS

Weber's Law

- Just-noticeable difference between two stimuli is proportional to their magnitudes
- Case study on length
 - Given two lines with lengths x and $x+w$
 - If w is small, it is difficult to notice difference between the two lines
 - If w is larger, it is easier to catch the difference
- How large should w be?
 - The probability of detecting the change is proportional to the relative value w/x

Weber's Law

- Given values (90, 92)
- Detect with probability of $2/90$

- Given values (90, 92)
- Detect with probability of $2/10$

Stevens' Law

- Model the relation between a stimulus and its perceived intensity
- Given a stimulus x encoded with a visual attribute
- An observer decode a perceived value $p(x)$
- Stevens' law states that
 - $p(x) = kx^\beta$
 - where k is constant and
 - β is a constant that depends on the nature of stimulus

Stevens' law

- Better effectiveness when $p(x) = kx^\beta$ is linear
- Linearity depends only on β
- Different visual encodings yields typical ranges for β
 - Lengths: 0.9 – 1.1
 - Area: 0.6 – 0.9
 - Volume: 0.5 – 0.8

Weber and Stevens' Laws

- Given two values x_1 and x_2
- Let the perceived values be $p(x_1)$ and $p(x_2)$

$$\frac{p(x_1)}{p(x_2)} = \left(\frac{x_1}{x_2} \right)^\beta$$

Weber and Stevens' Laws: areas

- For areas $\beta=0.7$
- Let $x_1=2$ and $x_2=1$
- The perceived difference will be

$$\frac{p(2)}{p(1)} = \left(\frac{2}{1}\right)^{0.7} = 1,6245$$

- For areas $\beta=0.7$
- Let $x_1=0,5$ and $x_2=1$
- The perceived difference will be

$$\frac{p(\frac{1}{2})}{p(1)} = \left(\frac{1/2}{1}\right)^{0.7} = 0,6155$$

Weber and Stevens' Laws: areas vs lengths

- For areas $\beta=0.7$

- Let $x_2=x_1+w$

- The perceived difference will be

$$\left(\frac{x+w}{x}\right)^{0.7} \approx 1 + \frac{0.7w}{x}$$

- For lengths $\beta=1$

- Let $x_2=x_1+w$

- The perceived difference will be

$$\left(\frac{x+w}{x}\right)^1 = 1 + \frac{w}{x}$$

Takeaway messages

- Data type for entities and relationships
- Visual variables for representation
- Mapping of types to VVs
- Some VVs are more appropriate for specific data types

FONTS

Fonts

Typographic parts of a glyph:
 1) x-height; 2) **ascender line**; 3) apex; 4) **baseline**; 5) ascender; 6) crossbar; 7) stem; 8) **serif**; 9) leg; 10) bowl; 11) counter; 12) collar; 13) loop; 14) ear; 15) tie; 16) horizontal bar; 17) arm; 18) vertical bar; 19) cap height; 20) **descender line**.

$$\begin{aligned}\text{Font size} &= (1) + (2) + (20) \\ &= (19) + (20)\end{aligned}$$

"Metal type". Licensed under Public Domain via Wikimedia Commons - http://commons.wikimedia.org/wiki/File:Metal_type.svg#mediaviewer/File:Metal_type.svg

"Typoghaphia" by F l a n k e r (typographic font designed by myself, named Imperator). Licensed under Public Domain via Wikimedia Commons - <http://commons.wikimedia.org/wiki/File:Typoghaphia.svg#mediaviewer/File:Typoghaphia.svg>

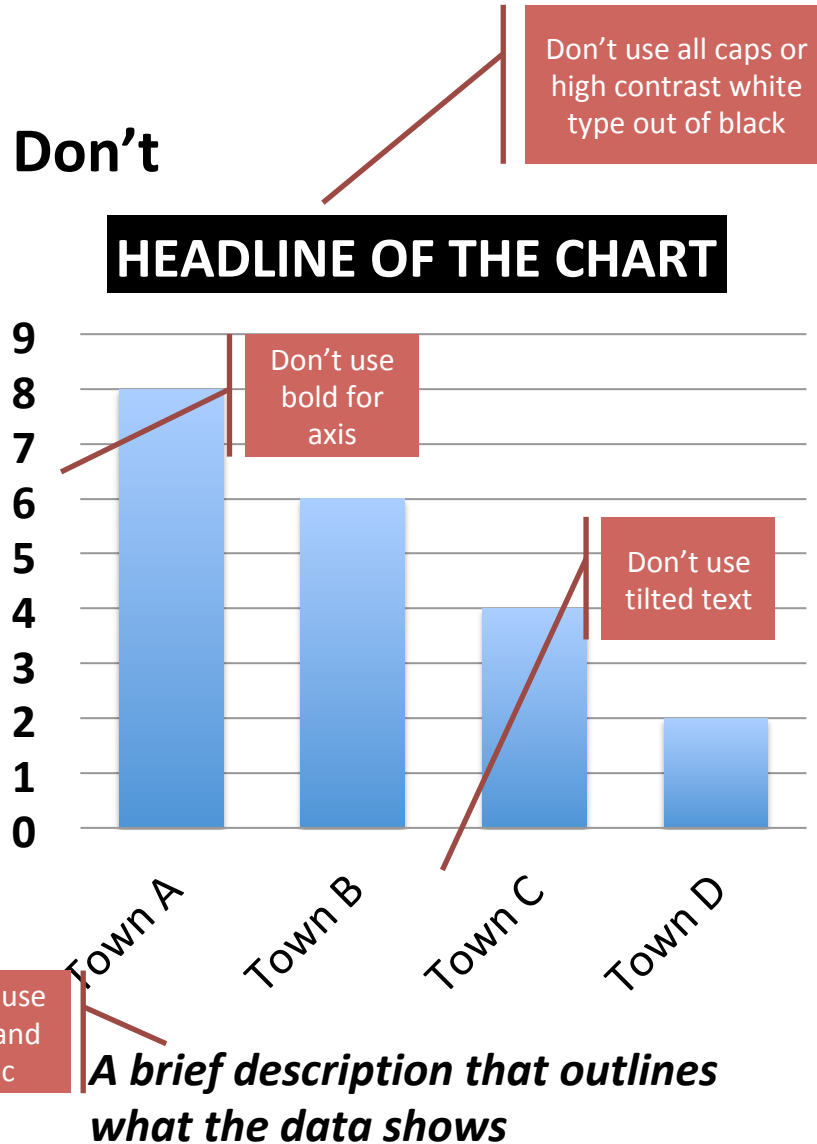

Fonts: general rules

- Leading should be 2 points larger than type size
- Avoid too small or condensed type faces
- Keep style simple: use **bold** or *italic* to emphasize a word (better not ***both***)
- Avoid ALL CAPS
- Avoid *styled fonts*
- Avoid C***C Sans Serif
- Reduce type at an angle
- Avoid t r a c k i n g

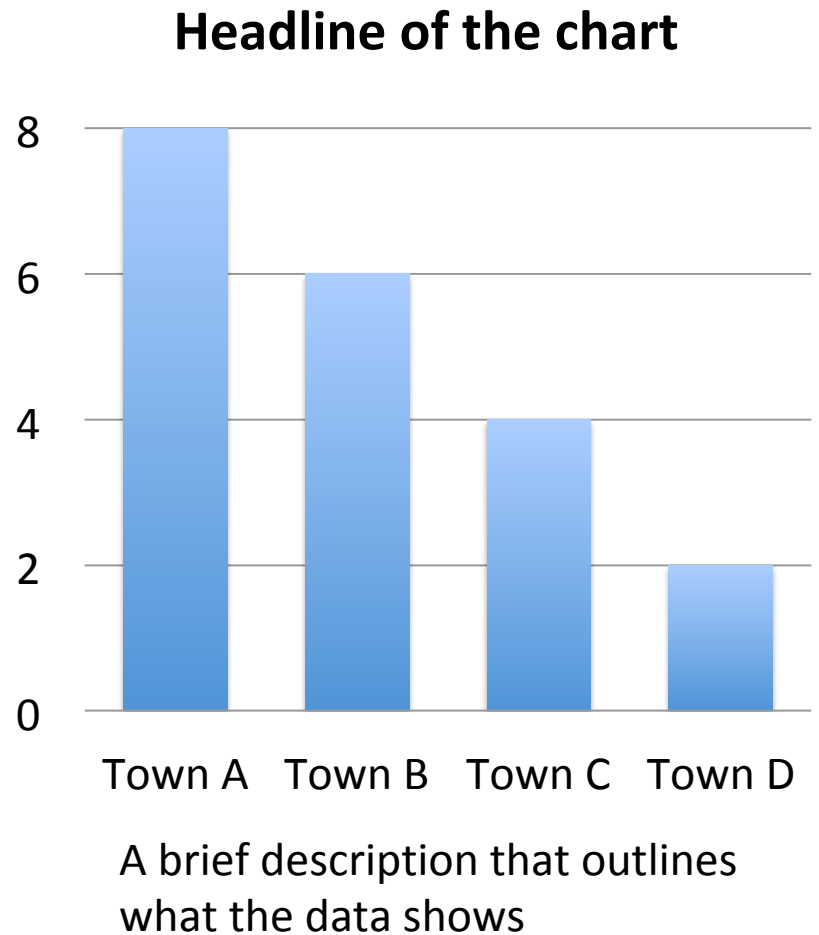

Fonts are meant to describe, not to adorn

Pies vs Bar charts

Furthermore, we present the distribution of attacks towards employees in detail in Fig. 10 right. The blue employees are secretaries, the green ones are administrators and the red ones are scientific employees. The number following the name is the number of times that person was attacked. All of the names are pseudonyms for real people. The person that suffered the most attacks is Monja a secretary with overall 8 attacks. In contrast, all other victims suffered between 1 and 3 attacks.

2016 Q4 GROWTH UPGRADED

Source: ONS

The Office for National Statistics (ONS) said gross domestic product (GDP) expanded by 0.7 per cent in the fourth quarter - an increase from the 0.6 per cent calculated on the watchdog's first look at the economy
